RAISINS—Prices per lb, f. o. b. Fresno, are as follows, 1905 crop: Seeded, per pkg: Fancy, 16-oz, 7¼c; do, 12-oz, 6c; choice 16-oz, 7c; do, 12-oz, 5¾c; fancy bulk, per lb, 7c; choice, do, 6¾c; Loose Muscatels, 50-lb bxs, standard, 4-crown, 6½c; do 3-crown, 6c; do, 2-crown, 5¾c; do, seedless, 4½c; do, floated, 4¾c; Thompson's Seedless, unbleached, 6½c; bleached, standard, 7c; do, choice, 8c; do, fancy, 9c; do, extra fancy, 10½c; Seedless Sultanas, unbleached, 4c; bleached, standard, 5½c; do, choice, 6c; do, fancy, 7c.

Honey and Beeswax.

HONEY—New crop, Comb, per lb., 10@12c; Extracted Water White, 6c; Light Amber, 5@5½c; Dark Amber, 3@4c; Hawaiian, 2@2½c.

BEESWAX—Per lb, 26@28c.

Beans and Peas.

BEANS—Prices per ctl: Large White, $2@2.40; small do, $3@3.25; Pea, $3.25@3.75; Lima, $3.40@3.50; common shipping points, $3.20; Red, $3@3.50; Pink, $1.75@2.15; Bayos, $3.50@3.75; Blackeyes, $4.40@4.60; Red Kidney, $3.50@4; Horse Beans, $1.25@1.75.

DRIED PEAS—Prices per ctl: Niles, $1.75@2; Green, $1.75@2.25; Field, $1.50@2.

Live Stock.

Conditions throughout all departments of the Live Stock market are purely a reflection of the features thoroughly reviewed for some time past. Sheep continue in scant supply and rule strong at full quotations and A1 Steers and Lambs share second place interest at firmly held rates. Calves and Hogs are plentiful at the familiar prices.

CATTLE—No. 1 Steers, 6½@7; second quality, 5½@6c; third quality, 5@5½c; No. 1 Cows and Heifers 5@5¼c; second quality, 4½@5c; third quality, 4c; thin Cows and Heifers, 3@4c; Bulls and Stags, 2@3½c. Prices for all descriptions less 50 per cent shrinkage.

CALVES—Light, per lb, 4¼@4¾c, gross weight; medium, 3¾@4c; heavy, 3½c gross weight.

SHEEP—Per lb: Wethers, No. 1, 3¾@4¼c, gross weight; Ewes, No. 1, 3¼@3¾c, gross weight.

LAMBS—Suckling, $2.75@3.25 per head or 4½@5c per lb., live weight.

HOGS—Per lb.: Hard grain fed, weighing alive 80 to 130 lbs., 5¼c; 130 to 250 lbs, 5½c; 250 to 350 lbs., 5¼c; rough heavy, 4@4¼c; common, 3½@4c.

Hay and Cereals.

HAY—Per ton: Wheat, $11.50@16.50; Wheat and Oat, $11@15; Oat, $8@12; Barley, $8@11; Clover, $7@10, Alfalfa, $6.50@9.50; Stock, $5@7.

WHEAT—No. 1 Shipping, per ctl, $1.36¼@1.40; inferior grades, $1.20@1.35; White Milling, good to choice, $1.40@1.43¾, and $1.45 for fancy.

BARLEY—Choice No. 1 Feed, $1.20@1.25; same fancy grades up to $1.26¼; common to fair, $1.15@1.18¾ inferior grades, $1.10@1.13¾; Shipping and Brewing, $1.26¼@1.30; Chevalier, nominal.

OATS—Good to choice White, $1.35@1.45; Red, $1.50@1.62½ for choice to fancy; $1.15@1.32½ for common to fair; black, for seed, $1.60@1.70; lower grades, $1.25@1.55.

RYE—Good to choice, per ctl, nominal; new, $1.45@1.52½.

CORN—Good to choice, per ctl: California, new, large, Yellow, $1.45@1.50; small do, $1.60@1.65; White, $1.40@1.45; Eastern Yellow, $1.40@1.42½; White, $1.40@1.42½; mixed, $1.35@1.40.

CITRUS MARKETS

The first car of new crop oranges was sent East on Oct. 28, from Exeter, Tulare county, and was consigned to Winnipeg, Manitoba, and the Tulare district expect to maintain an average of fifteen cars per day until the crop is cleaned up.

A few cars of old Valencia stock are still going forward from the southern end of the State, but the quality is deteriorating and the price is lower.

The first car of new crop navels was shipped Wednesday by the Altland Fruit Co., Orange, and was consigned to New York, but as a general thing the fruit is not yet in condition to ship.

New York.

Three cars of Valencias and four of lemons were offered Friday. The oranges were of indifferent quality, as a rule, but brought fair prices, averaging from $3.50 to $8.34 per box. Heavy offerings of foreign lemons were in the market, so Californias rule easier, averaging $4.52 to $5.54.

Monday brought four cars of Valencias and two of lemons. Oranges brought $5.79 for Old Mission on an average, other grades going as low as $3.56. Lemons steady, averaging $5.27 for ex fy to $4.17 for st.

Five carloads of lemons, but only one of oranges were offered Tuesday. The valencias brought from $4.08 to $5.36 on an average, while lemons were easier at an average of $3.43@$4.50, as to grade.

Two cars each of lemons and Valencias were offered Wednesday, Old Mission brand averaging $7.72, while lemons ran from $3.95 to $4.26.

Good openings for growers of small fruits near most every small town. Look about and see if the market is supplied with fancy home grown berries.

A HERD OF HOLSTEINS IN AMADOR COUNTY, CAL.

The record made at the St. Louis cow demonstration by the owners of the pure-bred Holstein-Friesians, shown in the accompanying cut, has created singular interest among dairymen, who heretofore have never been willing to acknowledge that the Jersey has a competitor. They are noting the accomplishments of the Holsteins with surprise. The above photograph is from the State Industrial Schools herd of Holsteins, located at Ione, Amador county, California.

CIRCULATION EXCEEDING 10,600

You You Yours

Your Business to Consider

A ton of Shorts or Bran or Chop Feed contains not much more than 180 pounds of digestible protein; while a ton of COULSON'S EGG FOOD contains over 300 pounds of digestible protein.

Now as "protein" is one of the most valuable parts of the feed for making eggs, you can readily understand that you will get more results from one ton of COULSON'S EGG FOOD than you would from a ton and a half of either shorts, Bran or Chop Feed.

Therefore, it would actually be cheaper for you and prove more profitable for you if you should feed your pullets and laying hens COULSON'S EGG FOOD every day.

Unless a food, however rich in protein, is relished, it loses much of its value.

Therefore, we make COULSON'S EGG FOOD in a condition that fowls will relish it.

They eat it greedily—THEY JUST GO FOR IT—because it tastes good to them and they like it so.

If you should feed only grain and a mash composed only of Shorts, Middlings and Chop Feed, etc., without any extras, in the way of animal foods, your average profit on your entire flock would probably not average over 75c per hen, per year.

If you should mix Beef Scraps, Meat Meal or Meat, etc., with the other feed, the profit might be increased to $1.00 per hen per year. If you should feed the hens COULSON'S EGG FOOD every day, a food that is just right, the hens will earn you a profit averaging from $1.25 to $1.50 per hen, and sometimes more, per year.

Now, if the above is true, and it undoubtedly is, one would do BETTER BY USING COULSON'S EGG FOOD, and save a lot of worry and both of mixing feed, etc.

(1¾) Tons of Shorts at $25.00 per ton would cost $44.00.
(1¾) Tons of Bran at $24.00 per ton would cost $42.00.

Therefore one ton of EGG FOOD is equal to $44.00 worth of shorts; it is equal to $42.00 worth of Bran, or $45.00 worth of Chop Feed or $50.00 worth of Corn; and it is better because it also keeps the fowls in more active and healthy condition.

COMMENTS:

184 EGGS PER HEN

Henry Graff, a prominent poultryman near Petaluma made a flock of 1400 hens average 184 eggs apiece during the past year.

THAT'S GOING SOME

Considering the large number of hens,—as there are always some hens that are not layers.

They were fed once every day on COULSON'S EGG FOOD.

I have fed your Egg Food for the past three months to my flock of 200 pure-bred Brown Leghorns with the best results. I believe it HELPS THE FERTILITY OF THE EGGS, as I have had a higher percentage of hatches than heretofore, and can cheerfully recommend to all poultrymen.
W. E. MERCER, Ventura, Cal.

This is the first season I have used COULSON'S EGG FOOD and I consider it excellent for the purpose. Since August last I have had MORE THAN DOUBLE THE NUMBER OF EGGS I ever had before from the same number of hens. A. A. HENRY, Rumsey.

I have fed your Egg Food and had good results.
S. M. BUTLER, (Arrowhead Strain B. P. Rocks.)

I find your Egg Food proves to be just what you recommend it to be.
E. M. SHELFORD, Cloverdale, California.

Have been using your feed since last August, 1904, and have never had such a healthy, happy lot of hens before. It carried them safely through the molt without any sickness and they are laying well at present with eggs at 35 cents a dozen.
MRS. E. M. HICKS.

Full particulars of your dealer. If he does not keep COULSON'S FOODS, etc., give us his name and we will tell you where and how to get them, and save you money.

A Sack of Coulson's Egg Food

The World Renowned
COULSON'S EGG FOOD

A Balanced Ration or Mixed Feed for Pullets and Laying Hens

Intelligent Feeding.

Feed the hens Coulson's Balanced Ration Egg Food. You can buy it nearly as cheap as wheat, and it will make the hens lay better than any other food.

A hen is simply an egg-making machine. Feed her properly and she is bound to lay eggs regularly. Feed as a mash one meal a day. Simply wet it up with a little water or skim milk, and it's ready to feed: it saves you time; it's the busy man's friend. Feeding a properly balanced ration the year round will yield double the profits if you feed COULSON'S.

Take the sack of Coulson's Egg Food, dump some of it out in a box—pour some water or skim milk on it. Stir it up so as to make a dry mash, (meaning not too wet), then pour it into the feed troughs for the growing pullets and laying hens. They should be fed COULSON'S one meal every day.

The supreme test of a hen is her Egg-Making Capacity. A good hen should lay about 200 eggs per year, which she will do if fed regularly on COULSON'S EGG FOOD.

Cut out this slip. A handsome needle case free.

Trees in the Landscape a Valuable Asset

By A. J. Wells

Beauty is not quite as necessary as bread, but it has its place in the scheme of human life. A man need not be indifferent to his surroundings because he has to grow potatoes, nor be blind to the esthetic value of a tree because it yields him a bag of walnuts or a crate of cherries. His eucalyptus trees will pay for their board in firewood and honey, but meantime they are a delight to the eye and an addition to the landscape. Emerson puts it in homely verse,

"One harvest from your field
Homeward brought your oxen strong;
Another crop your acres yield,
Which I gather in a song,"

and it may be that a wise estimate of life would show that this unseen harvest is as valuable as the one we haul into the barn, or sell in the market place.. It does not count on the ledger, but does in the growth of life. We may be so related to the fields we cultivate as to get out of them something for the character as well as the purse.

In that powerful story which yet failed called "Dred: a tale of the Great Dismal Swamp," Harriet Beecher Stowe makes one of her characters say, "I have no respect for a man who does not appreciate a tree," and he goes on to commend historic Xerxes because he was moved once by the wild grace of a tree, and ordered it hung with chains of gold. A graceful tree is its own excuse for being, and its beauty cannot be enhanced by gew-gaws. When one was cut down against his protest in the temple grove at Okubo in Japan, Lafcadio Hearn built him a new house a mile away, that he might not be distressed daily by the sight of the ugly gap left in the grove.

The tree's place in the landscape cannot be taken by anything artificial. It is an essential part of the beauty of nature and no landscape is lovely that is naked. The monotony of our wide California "plains" is splendidly relieved by the park-like groves of oak which dot them. We have destroyed our forests almost wantonly, but we cannot see the rugged lines of these California oaks without respect for the farmers who have spared them for the sake of the landscape.

One hitched his horse to a valuable tree in front of Judge Blank's door, and when scored roundly for the damage that resulted, said, "I guess I can pay for it." The reply was, ""It took God Almighty a hundred years to make that tree, and you won't live long enough to pay your debt."

The oaks which are the glory of our California valleys were long in making, but most of them are old and childless, and they will gradually disappear. They are too few and far between for the best landscape effects, for which height and mass are essential. Nothing will serve us here better than extensive groves of eucalyptus. If we could spare the land for belts of these evergreens—for woodlands rather than household groves,—if towns could provide on the windward side real forests of a dozen or more varieties of these exotics from hot and trees are quickly grown. Too often comfort in the house and in the school room, and beauty around both are lost sight of in the effort to get on, and beauty as something to be cultivated, trees for the sake of the landscape or ornamental grounds as an investment are thought to be quite outside the range of " practical life." When E. P. Powell, the writer and horticulturist, devoted one-third of his home place of 13 acres at Clinton, N. Y., to ornament, an old farmer chided him for being a fool. He replied, "I will get more income from the rest than you will get from your whole farm," and later, when from his highly improved acres he sold four for $5000, and was able to show a good

Courtesy Cal. Northwestern R. R. Co.

Where Trees Make the Landscape.

the antipodes it would add to the joy of living in many ways. It would break the sweep of desert winds or "north winds," protect orchards and gardens, filter and arrest dust laden currents of air, conserve and balance atmospheric moisture, modify the aridity of summer, temper the winds of winter, be a refuge for birds, a shade for stock, and last of all and best of all, a delight to the eye wearied by too much sun.

In the country the gracelessness of ranch buildings is accentuated often by their nakedness, and forlorn school houses are frequently seen setting sunburned by the wayside, a reproach to us in a land where summers are surplus beyond living expenses from the balance, his critic surrendered. "You've cultivated the beautiful, and by gosh you have made money at it.' We have not learned the A B C of country life if we do not know that profit may keep step with beauty in a thousand ways in California.

I saw the district below Los Angeles for the first time in 1882. The brown and gray plains were almost treeless, and flat and unattractive. Today that region is transformed. "Blue gums" have been widely planted for fuel and what was meant for a bit of farm economy has become a feature of the landscape, and it is not too much to say that every acre has been enhanced in value by the beauty of the groves. Between Naples and Elwood on the Coast Line of the Southern Pacific is a ranch made attractive by a series of windbreaks of Eucalyptus, and doubtless the stock in the fields, as well as the farmer, is made more comfortable. Adjoining this handsome place on the south is a "camp"—I can not call it a home set down in the open field, farm house and farm buildings and corralls swept by the wind and swimming in the sun, not a shrub or tree in sight.

In our great valleys few things will help to promote settlement more than tree planting. The squalid look of many country homes on these plains would be relieved by a few clumps of Eucalypti, and judiciously planted, they would be profitable as windbreaks. For these we would prefer E. rostrata, the Red Gum with E. polyanthema the Red Box or Australian beech and E. rudis, which does well in dry sections. For single trees or groups E. Sideroxylon or iron bark and E. corynocalyx with its white stem and red branches, and E. botryoides, a rapid grower and a handsome and vigorous tree are all desirable.

I would add, I think, for shelter and beauty and later use, the Catalpa speciosa. It will serve the landscape well while providing the best fence posts in the world and when mature

(Continued on Page 455)

BY J. W. MILLS, POMONA, CAL.

FERTILIZERS OF OLIVE TREES.

Of all the fruits grown in California perhaps the olive has been planted upon the most unfavorable soils for profitable production. This has been the result of an early idea, and one which is as yet to some extent prevalent, that the olive tree would do well upon soils much poorer than other trees would stand. As a result of this mistake in the earlier history of fruit plantings there are now large numbers of olive plantations which have failed to produce profitatble returns, and in many cases have been dug up and replaced by other fruits. It is altogether probable that careful attention given to the matter of feeding the trec would have rendered it possible to save many of these orchards, and to have secured fairly profitable returns, and perhaps more profitable returns than can be secured from the same soils planted to other fruits. Still there are many such orchards remaining in the State and there is an increasing demand for information as to the plant food required by this crop. This is becoming more and more apparent on account of the continued failing of these orchards, not only to produce crops, but also from the general debilitated condition of the trees themselves.

While it is true that the olive tree is not a gross feeder as measured by the crop, yet it demands a sufficient amount of plant food as do all other trees, and in this respect differs from them only in degree. The oil, which is the most valuable part of the fruit, is not formed from the ingredients in the soil, but for it to be developed to its maximum extent there is required a healthy development of the tree and the other parts of the fruit. The vegetative functions of the tree must be healthy and active, and this can only be brought about by the presence of abundance of readily available potash, nitrogen, and phosphoric acid.

A full grown olive orchard may be considered as removing from the soil the following ingredients per acre for a crop of 2200 lbs. of fruit leaves, 4400 lbs. and wood 11,000 lbs.

Potash (fruit) 18.81, (leaves) 58.05, (wood) 24.46; phosphoric acid (fruit) 2.59, (leaves) 20.08, (wood) 14.86; nitrogen, (fruit) 12.86, (leaves) 69.90, (wood) 117.69.

It will be seen that in the fruit alone there is the heaviest draught of potash and on the soils on which so many of these orchards are planted it is this element that is likely to be lacking. While in some soils of California potash may be sufficiently present in these particular cases this element is one which should be given the most careful attention.

To increase the nitrogen content and improve the moisture conditions the practice of green manuring with a leguminous crop is to be highly recommended in these orchards. For this the vetch, lupines or the Canadian field pea can be used successfully, and the mineral ingredients alone supplied for direct fertilization. Further the pomace after the extraction of the oil makes a valuable fertilizing material, for the addition of organic matter to the soil. The phosphoric acid may be applied either in the shape of basic slag or bone superphosphate. and the potash either in the form of sulfate or muriate of potash.

A general formula for use on these orchards may well be made up about as follows:

Nitrate of Soda.....	300 lbs.
Superphosphate.....	500 lbs.
Muriate of Potash....	125 lbs.

The above quantity to be applied to one acre of ground. This fertilizer may be applied broadcast in the fall and thoroughly worked into the soil. If it be in the northern part of the State, it may be well to apply only a portion of the nitrate in the fall and to add the balance in a spring application to avoid any possibility of loss from leaching during the winter months. In the southern part of the State there is not much danger. As to the other ingredients, there is practically no danger of loss as the mineral elements become fixed in the soil in such a way as to prevent leaching, but so they will still be available for the use of the plant.

With these orchards planted in such untoward places there is no other way in which their fruiting can be maintained to a profitable point except by heavy dressings of commercial fertilizers. Unless the farmer is prepared to feed these trees liberally they might as well be destroyed, as there is little hope for their being more than a constant load to carry. Under the conditions under which they are growing it is impossible to expect any profitable return.—George Wright

OLIVES TO BOOM.

The executive committee of the Sacramento Valley Development Association has decided that if it is desired by a considerable number of the representative olive growers and olive product manufacturers of the Sacramento Valley a meeting of those interested in the olive industry will be called at some time in the near future to discuss the needs of the olive men of this part of the State.

The Sacramento Valley is the great olive producing region of California, and it is believed that this fruit properly handled will have a great future, particularly the olive pickling industry. At present the crop is principally handled in small establishments and some growers have expressed a desire to see the olive men of the whole valley get together and consider the situation with a possible view to creating an organization to handle the crop in a large way.

If farmers and orchardists would pick off all imperfect fruit, it would be better for the trees and better for their pockets when fruit is marketed. If only No. 1 fruit was sold the market would never be glutted. All No. 2 apples should be dried or made into cider.

TWO SOURCES OF OUR WEALTH.

Fresh Deciduous Fruits. The shipment of deciduous fruits in a fresh state by carload lots from California during 1905 will approximate 8000 cars, of which 6376 cars have gone forward to date, leaving about 1750 cars of apples and pears yet to be shipped. This total is the largest ever recorded and exceeds last year's shipments by over 2000 cars. Prices this year (considering all varieties of all kinds of fruit) have probably exceeded those of any other season. California fruit growers will receive more than $5,750,000 for this output, which does not include canned or dried fruits. About 250 cars were also shipped by express in small lolts during the season.

The Wine Industry. Callifornia will this year contribute between 70 and 75 per cent of alll the wine legitimately produced from grapes in the United States. The cost value of this vintage will be about $7,500,000, calculating the grapes at a paying price to the vineyardists, cooperage not included. The selling value will be approximately $10,000,000, including cooperage. More than 20,000,000 gallons of wine and brandy will be shipped from California this year.

LIME, SULPHUR AND SALT SPRAY.

Editor Cultivator: (1) In the last number of the Cultivator I noticed a formula of lime, sulphur and salt for spraying deciduous trees. Can this mixture be prepared fast enough to keep a power spraying machine steadily running, the machine using from 1000 to 1200 gallons per day?

(2) Which of the two—the lime, sulphur and salt formula, or the bordeau mixture—is the better for spraying apricot trees for shot hole fungus, etc?

(3) In the directions given in the University bulletins for using the bordeau mixture, it prescribes the use of a wooden tank. Will an iron tank do as well by using a little more blue stone, and how much?—J. T. Santa Paula.

(1) The mixture has to boil fast for one and a half hours; so that you may figure how much tank and barrel room you will need. (2) Bordeaux, the other is not a fungicide. (3) Do not use iron, get a lot of barrels or tank of wood.

There are a few points about Bordeaux not generally set forth in directions for preparation and use. Suspend your blue stone in a sack near the surface—it will go to the bottom fast enough—if you put it in the bottom of barrel you will have a hard job stirring it up. For best results, two should mix—one pouring the lime and the other the blue stone into a third barrel at **the same time.**—not first a pail of one and then of the other. The lime should go through a strainer.

Chickens and berries do not go well together. They soon get together all right, but for profit it is better to combine small fruit and gardening.

WANTED.

A subscriber writes the Cultivator asking where he can purchase some Lady Thompson Strawberry plants. Who has them?

Another writes asking regarding the Black Bishop grape. This is a new one to us. Can any subscriber inform us where to get cuttings?

IT'S PENNY WISE

Policy to set out a good tree, costing good money and then let the sun burn the bark, or the rabbits gnaw it when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Mfg. Co., 2124 Willow St., Los Angeles.

RANCH FOR SALE
Thir een acres Walnuts and Fruits. Good Improvements. Cheap wa er and plenty

GOOD ROADS.

By Professor A. J. Cook.

Berlin, Germany, Oct. 21.

If there is any one thing that aids a country more than aught else it is good roads. When we at Claremont decided to raise from $1000 to $1500 annually for our roads, on condition that the Supervisors appropriate as much more, we were indeed wise. We rejoice in our good roads, and if I except Azusa, I know of no place in our section that is better provided with roads than are we.

The past month I have travelled not a little over the roads of England, Ireland, Scotland, France and Ger many. The thing that has pleased me most of all is the perfection of the roads, especially those of England. Everywhere that I have been and that has been twice through the country, from north to south, once on the east side and once on the west. The roads have been "things of beauty" and most truly "a joy fovever." While one must be charmed with the landscape of old England, in its entirety, for in neatness and finish it is incomparably fine. Yet to me the roads, or highways, possess a charm that is indescribable. All my life will be richer for the pleasurable memories that abide, of the wondrous drives in the lake region of England. The roads are not only perfect in themselves, as they are all composed of McAdam finish or crushed rock, and are kept in absolute repair, but they are never in straight lines, but always curve gracefully, with such gentle curves that one is never vexed by the thought that he is being pushed from his way or is forced to go farther than he ought to go. The moss grown stone wall or beautiful green hedge rows which invariably limits the roadway, especially in the sections of England and Scotland, that I most admired, are also exceedingly attractive.

The roads in Europe are also much more narrow than in our country. I remember once at an Institute in Redlands. Mr. Albert K. Smiley gave an admirable talk on methods to improve our roads, and highways. He urged that we make our roads more narrow and then keep them in better condition. I think Mr. Smiley must have had a picture of these English roads in his mind. They are often so narrow that the drivers of the coaches must be cautious or there will be collisions. Often the space is nearly consumed by the two passing coaches. Yet in all our riding and it has not been a little, we never saw an accident, and were told by the drivers that collisions were very rare. When one is conscious of the necessity, then caution is more certain. Another thing we have observed with sincere admiration. I refer to the clean roadsides. I am sure that more time should be spent in keeping our road sides clean from the ugly weeds that so generally disfigure our California landscapes. These weeds furnish innumerable other weeds that are a perpetual menace to all adjacent fields and lawns and mar the beauty of our country most seriously. It would be a tremendous improvement could they be exterminated. Would not more than anything else the narrowing of our roads, help to remove and keep weedless the road sides? The roads of England are very beautiful in this regard. There are no weeds and wherever the width permits there is a beautiful grassy strip for a border, that adds materially to the charming effect.

As I have thought of the marvellously beautiful and well-kept roads of England, I have wished that some Rockefeller or Carnegie—some man with millions—might set an example by a most generous donation that should look to landscaping and improving the roads of some state or possibly county, along lines suggested by the English roads. Surely the great benefit from such an object lesson would be as leaven and soon we might hope to have our country like the England of today, glorious in its beauty.

The perfect condition of the English roads is due, largely, to the fact that they are constantly watched and cared for. Here truly the "stitch in time" saves more than nine. Everywhere in England and the same is true in all the countries we have visited in Europe, one sees little mounds of pounded or crushed stone beside the road, at very frequent intervals. This material is ready to give the timely stitch. This makes needed repairs more easy, and is more likely to insure ready application of the "stitch in time."

We only need this European method of a timely ever-ready heap of gravel, when, I am sure, we shall have made a good advance towards copying the European excellence.

* * *

Save the Manure.—One thing that has interested me greatly since I came to Europe, is the vast amount of stable fertilizer that is used much as we prize barn-yard manure in our newer country, with its soil, as yet almost in a state of virgin richness. Yet we are far behind Europe in our appreciation of this home-made fertilizer. Even in the older sections of the United States stable fertilizer is greatly prized. Prof. Powell says that with very liberal use of fertilizers his father's apple orchard has approximated to a condition of annual crops. The off years have been eliminated Mr. Powell to hasten matters used cover crops. Here in Europe the roads are all swept that no jot of the precious substance may be lost. In some sections, even out in the country, people are glad to sweep the streets for the manure that may be secured, and in one section near the home of the late Mr. Gladstone, farmers even pay for the privilege of sweeping the streets. It must be remembered, however, that the hard narrow streets can be very easily swept. As our country gets older, we will prize more highly everything that adds to the strength and fertility of our soils. As we progress we shall show our advancement possibly most by our good roads, and as the roads are made hard it will be very easy to sweep them and save the fertilizers. If at the same time we narrow them down to the standpoint of utility, and keep them weed-free and possibly green with alfalfa, we shall practice an economy that will be wise as it is absolutely necessary, to our less fortunate friends of the "Old World."

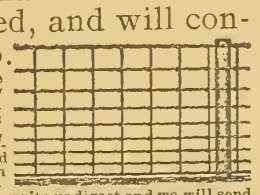
ATTRACTIONS OF FLOWERS FOR BEES.

Some of our scientific men have raised a peculiar question when they seek to discover whether it is the color or the scent of flowers that attracts the bees and other insects to them. The result of these investigations is that color is what draws them. We may not see anything of practical benefit in this discovery, but we can not blame our scientists for pursuing such investigations. The first step in all such matters is to learn the facts; then the practical application of these discoveries. The first discoveries pertaining to electricity were carried on to satisfy curiosity. No scientists ever dreamed in those days of the extensive practical application of their discoveries. The expansive power of steam was discovered by the idle curiosity of a boy. We should bid speed to all scientific discoveries, regardless of what may be the practical application to which they may be turned. The scientist with his discovery of facts must precede the inventor, who could do nothing but for the discoveries going before him. But aside from this relation of the scientist to the inventor we can see the hand of the Divine Ruler in giving color to flowers. This guides the bee and other insects to them and the benefit is not alone in the honey they gather and store up for their own use and that of man, but such insects perform an important work in the pollenation of fruits. In some cases without this work of insects no fruit would be raised at all and in most cases great benefit comes to fruit by this cross pollenation.

Ambition is torment enough for an enemy; for it affords as much discontentment in enjoying as in want, making men like poisoned rats, which, when they have tasted of their bane, cannot rest till they die.—Bishop Hall.

AMERICAN FENCE TALKS
By the Makers

There are many fences on the market. Some tell of their wonderfully hard wire; others speak of new form of construction that make all other forms look ancient and worthless. But through all this it remains a fact that more miles of American fence are in use than of all others combined, and will continue so.



American fence is for sale by the dealer in your town. You can find it there, examine the different styles and make a selection to suit your requirements. Or, write us direct and we will send you a catalogue and tell you where you can get the fence.

NEW PROCESS FRUIT SHIPPING.

It is said that necessity is the mother of invention, and the necessity for some better methods of fruit packing has not been more forcibly impressed upon any one than upon Mr. A. R. Sprague, manager of the California Fresh Fruit Exchange. Fruit for shipment is gathered during the hottest part of the summer season. Of course, it is heat that ripens and ripening itself generates heat, which long continued becomes decomposition. Stopping this heating delays decomposition, hence cold storage and refrigerator cars. Now when fruit is first packed in cars direct from the orchard or vineyard it carries all its warmth with it and the car itself is heated, a very marked rise in temperature being noted as soon as the car is filled with fruit. With the ordinary ice chambers in the cars this temperature is not greatly reduced for 24 to 48 hours and in the meantime the fruit is advancing so far toward the state of decomposition. Mr. Sprague undertook the problem of reducing the temperature in a short time, stopping the ripening process and so getting it to market in better condition for keeping. To this end he has invented a process which he has named the Cyclone method. In this method a large pipe is attached to the ice chest in the car, which is hermetically sealed when packed and the air is alternately exhausted and replaced by a large blower or fan, the hot air being discharged in the open and then being replaced by the cold air which is passed through the ice chambers. The writer recently examined this operation with a carload of grapes which showed a temperature of 73 degrees when the car was first closed and which was reduced to 43 degrees in a little over half an hour by this process. When the temperature has been sufficiently reduced the cars are sealed and the ice in the chests will keep the temperature down until the fruit reaches its destination. A number of experiments were made before the success was attained, but the machine has been in successful operation since August and returns received from the East show that it is a marked success.

* * *

HEAVY INCREASE IN FRUIT SHIPMENTS.

In the beginning of the fresh fruit shipping season, there was great complaint as to the smallness of the crop and predictions were made that shipments this season would be very light. In these columns I predicted that the shortage was not real, and that shipments would be as heavy or heavier than usual, and the result has borne out this prediction. California is a very large State, and each year in some parts of it crops will be light, and those who are suffering will be heard from, but when we come to figure up results for the whole State they always reach a good average. It has been so the present season. In the principal peach sections the crop was poor,, in the pear districts great damage has been done by the pear blight, yet in spite of these drawbacks there have been nearly 2,000 more cars of fresh fruit shipped out of Northern California this season than last, the figures up to the first of November being 7,457 cars for the present season against 5,626 for last.

This heavy increase in shipments is due to the greater demand in the Eastern market, very much better prices paid to the grower and the somewhat lessened pack of dried and canned fruits. Grape shipments are still going forward and it is likely that the full 2,000 cars increase will yet be made before the season is ended. Prices, too, have been so much better than in previous seasons that the fresh fruit growers are prosperous in spite of the gloomy outlook at the beginning of the season.

* * *

WORK ON THE PEAR BLIGHT.

Prof. M. B. Waite, Pathologist in charge of Orchard Diseases for the Department of Agriculture, who has taken charge of the pear blight campaign in California, will arrive the latter part of the present month to commence the winter work. Mr. P. J. O'Gara, his assistant, was to have accompanied him, but that gentleman has been incapacitated by sickness, and Prof. W. M. Scott will take charge of the field work here this winter. Prof. Scott was for five years State entomologist and pathologist of Georgia, and is, next to Prof. Waite, the best equipped man for this line of work in America.

* * *

MONEY IN TOKAY GRAPES.

There has been a perfect boom in the planting of Tokay grapes in Sacramento and northern San Joaquin counties the past two years, and the new acreage will run well into four figures. It has been demonstrated that this variety of grape does exceptionally well in this locality, attaining large size with very large clusters and of high color. The Tokay is a very attractive grape, a good seller and a good shipper and has brought unusually good prices in the Eastern market this year, growers having received from $250 to $700 gross per acre for their grapes this season which, after paying expenses, still leaves a very good balance. It is not likely that this business will soon be overdone as the Tokay does not give its best returns from all soils or locations and there is still room for expansion as the eastern market for this fruit is a growing one. Other table grapes have also given splendid returns to their growers this year and so far over 1600 carloads of this fruit have been shipped to the Eastern consumers. The principal section devoted to table grapes and from which the heaviest shipments are now being made is in the vicinity of Lodi, in San Joaquin county, and the money coming into that section for table grapes is giving it an air of prosperity unsurpassed by any section of the State.

FEATURES OF THE NEXT FRUIT GROWERS' CONVENTION.

There will be a very attractive programme presented at the next Fruit Growers' Convention, which opens at Santa Rosa on the 5th of December. Among the features will be an address by Governor Pardee, who has always been a strong friend of the fruit men; an address by Prof. M. B. Waite on the pear blight, illustrated with lantern slides, followed by an address by Prof. Ralph E. Smith on the work done against this disease in California during the past summer. Prof. David Starr Jordan, of Stanford University, and Benjamin Ide Wheeler of Berkeley, will both address the assembled fruit growers. It is expected that George Compere will have returned to California by the time the convention meets and will give some account of his adventures in searching for beneficial insects. Luther Burbank will also take part and Prof. Wickson will tell us about Burbank and his work. Efforts are being made to get Prof. Vernon H. Kellogg, of Stanford, to give an illustrated lecture on insects. There will be a County Horticulturists' day, and for entertainment, the ladies of Santa Rosa will give a social evening and the electric railway companies will give excursions over their lines. Altogether this convention promises to be at once the most interesting and profitable of all that have been held in the past thirty years.

CITRUS FRUITS

By C. A. Day, Pasadena

INSECT PESTS ON LEMONS.

The lemon tree is subject to the attacks of the red and black scales, and on account of the vigor and free flow of sap the lemon tree develops and supports a large quantity of scale and with the black scale the attendant fungus. The scale are not only a severe draft on the vitality of the tree, but the red scale when in sufficient numbers render a percentage of the fruit unmerchantable or injures the appearance of the fruit, even when removed or destroyed. The black scale is not only a draft on the tree, diminishing the quantity and impairing the quality of the fruit, but by the attendant smut makes washing necessary. One grower reports his bill for washing to have been $500 for a single year. When we consider, with black scale, the reduction in size of crop, the cost of washing and the attendant delay, and when we consider the draft on the tree from red scale and the injury and waste of fruit, it would seem a matter of economy to keep the tree free from scale insects.

* * *

Lemon Rot.—There has been considerable loss in the past year from lemon rot. This disease of the lemon is infectious and the careless mixing of a few diseased lemons with healthy ones has resulted in the infection of the healthy fruit.

Blue vitriol is used in the washing water to disinfect and destroy germs of brown rat.

GREAT YEAR FOR LEMONS.

The magnificent returns which have resulted from marketing this year's crop of lemons have been spoken of in the Cultivator and especially the following item which is exceedingly interesting. But as it has never been given before in detail at all, we mention again more fully.

The San Fernando valley is the producer of the lemons in question and, to be more particular, they were grown upon the ranch of Mr. C. D. Hubbard. Mr. Hubbard has something like six hundred trees and they will bring him this year most magnificent compensation for the years of waiting until the lemons should prove of some profit. The particular car in question which we have mentioned was No. 18186, F. C. E., which was sold on September 2d. The car contained two hundred and twenty-nine boxes of extra choice, eighty-three boxes standard, three hundred and twelve boxes all told. Quite a number were discounted because of off sizes, some to the extent of one dollar per box, others to the extent of fifty cents per box, but, with all the discounts, the car netted f. o. b. San Fernando, $2252.17. After the cost of packing, boxes, etc., there is still a handsome return to the grower.

Not only this car, but Mr. Hubbard shows us sales for other cars, one of which sold for $1440.60 and another for $1407.97 which, in an ordinary year, would look good to any lemon grower.

These figures are not given with the expectation of booming the business or doing other than mentioning this one fact that the stayer in any business is the one who is reasonably sure of winning out. Had Mr. Hubbard gotten discouraged a couple of years ago, when lemons were very generally being cut off and rebudded to oranges, he would have missed the magnificent returns of this year's output.

BETTER PRICES FOR ORANGE TREES.

Mr. Teague of the San Dimas nurseries and many other nurserymen, have informed us during the past few weeks that the scarcity of A No. 1 orange trees this season, together with the fair prices which prevailed for fruit during the season will cause a materially higher price than prevailed last year. Mr. Teague also told us that he already had received numerous orders for trees for the coming season's planting, one of these being from South Africa but that, of course, affects the local trade in no way. But the local demand will be much more keen, especially for Valencias. This leads to the conclusion that the careful planter will be looking eagerly for first-class trees early in the season. The writer was in Mr. Teague's nursery only a few days ago and saw trees which certainly are the equal of any which he has ever turned out, which is saying much, for Teague's nursery has a reputation which extends farther than the boundaries of this State and even farther than the boundaries of this country.

USES FOR CULL ORANGES.

Experienced orange growers estimate that for every carload of oranges shipped one ton of culls remain on the ground, which means 25,000 to 30,000 tons of cull oranges a year, of which no use whatever is made except to plow them under and let them produce whatever humus they will. If these could be sold for $5 per ton delivered there would be a little for the grower and a good deal for labor. The buyer, also, would have employment for capital and labor in making them into commercial products. For many years there has been talk in the southern counties about utilizing these culls and some attempts have been made to do so, with little success. The trouble is not in the production of excellent products, but in marketing them at a profit. A good deal of use is made of them in Europe, the British and British colonies being especially large consumers, but the British taste is decidedly for the bitter flavor, and without the bitter orange it would be useless to attempt to compete in European and colonial markets. There is some demand for dried and candied orange peel, but it is easily satisfied. Nevertheless it is not difficult to prepare many excellent products from cull oranges and lemons and mercantile ability and persistence would certainly make a reliable market for them in the United States, where England marmalades have a very limited sale and the public has not acquired a taste for the bitter orange, which, however, we could readily produce ourselves in sufficient quantity for flavoring purposes.

It has been estimated that it would require 60,000 boxes of oranges per day, or 2,219,000,000 boxes per year to supply the demand of the 90,000,000 people of the United States and the several millions in Canada.

CLIMATE AND CROP REPORT

U. S. Department of Agriculture, Climate and Crop Bulletin of the Weather Bureau, California section, for the week ending Monday, Nov. 6.

Clear and warm weather continued most of the week, with heavy fogs in the central coast districts. High northerly winds prevailed at the close of the week and heavy rains fell in Southern California on Sunday. The precipitation at San Diego for 24 hours was 1.68 inches and at Los Angeles one inch.

Oranges are somewhat backward in Southern California, but picking has commenced in some places. In the Porterville and Oroville districts orange harvest is in progress and shipments are being made to local and eastern markets. The outlook is good for an excellent crop. Orange shipments from Southern California for the season just closed amounted to 30,000 carloads. A good crop of olives is being harvested. The apple crop is nearly all gathered and is one of the best ever grown in the State. Grape harvest, raisin making and fruit drying are practically completed and wine making is nearly finished. Taken as a whole, the yield of deciduous fruits and grapes has been very satisfactory. Walnut picking and shipping continue; the nuts are of good quality but the yield is less than average in most places.

The soil has become so dry and hard in some sections that plowing and seeding have been suspended, but farm work still continues in other sections. Rain is badly needed in the central and northern districts, both for softening the soil and to start pasturage, which is rapidly failing. The rain in Southern California was of immense benefit to orchards, ranches and pasturage. The hay and grain crops are under cover and harvest is about completed on corn, beans, potatoes and sugar beets.

VALENCIA LATE

And all the leading varieties of Orange, Lemon and Marsh's Seedless Grape Fruit Trees for sale. Are principally two years from bud and very fine. Can furnish from my nurseries at Gendora, Riverside or Redlands, as desired. Address

FLORICULTURE AND GARDENING

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

EREMURUS.

As a plant for the herbaceous border, E. robustus has no competitor in its own class, and it has not been widely grown because there has been some uncertainty in getting roots of flowering size. It is becoming better known, however, and has friends wherever it is seen. The root is hardy, its flower spike in the early spring, pushing into growth early in the season. There are several species in cultivation (natives of India) all with pale pink or white flowers, and all growing to a good height—six to ten feet, according to species and vigor. The Eremurus is to the early border what the popular Hollyhock is to the later display and should be equally valued.

SHIRLEY POPPIES.

Pick as soon as mature. If allowed to form seed the plant will have achieved the purpose of its existence and make no further worthy effort. If seed of particular plants is desired, select the best blossoms of a plant and cut off the rest. The Shirley in a distinct species. The Nudicaule is classed by seedsmen as the "Iceland," and is in single and double; is a hardy perennial. They are best sown where they are to remain.

PRETTY DECORATIONS.

At a recent dinner a flat decoration was used. It was a large star of flame-colored gladioli. These low flower centerpieces bid fair to be popular. Another form they have taken is the pond decorations. This is a square, long or oval glass dish of good proportions. It is filled with water and the edges are concealed by strips of bark. In this dish sprays of aquatic grass and umbrella palm are grouped with not too many pink, yellow and white water lilies. This, of course, must be used for a day function, as the lilies will close at night. A similar evening decoration could be made of asters and Harrisii lilies.

PLANT FERTILIZER.

One pound nitrate of soda; 1 pound sulphate of ammonia; 1½ pounds sulphate of potash.

Directions: Mix well and keep in a tight glass jar. For a small collection one-quarter of the above would be sufficient for a year. Use one tablespoonful to one gallon of water. Apply once a week for a month, then once every ten days until the plant indicates the resting period is at hand.

A NEW LILY.

At one of the shows of an Eastern Horticultural Society, last year, there was exhibited a new variety of lily, to which a gold medal was awarded. We do not learn that a distinct name has been given, except that of Farquhar's Christmas Lily. It was discovered by one of the above-named firm in the island of Bengnet. It is supposed to be a form of Lilium Philippinense, hitherto undiscovered though the original species was introduced in the early seventies. The plants from which the flowers were cut were grown from very small bulbs, planted in the greenhouse in May. The flowers, which are white and of the longiflorum type, have an average length of twelve inches.

STONE CROPS.

The family of sedums, usually known as "stone crops" contains some valuable, interesting and highly ornamental plants. They delight in the hot sun and are therefore particularly adapted to Californian conditions. Their culture is a very simple matter as they require but little care, little moisture or plant food, so that everyone may with safety assume the responsibility for caring for these interesting plants.

THE SWORD FERNS.

From the Boston Fern we have numerous varieties of horticultural value. The Pierson Fern is one of these and it makes a fine show with its much-divided fronds, long and drooping as those of the Boston fern. Mr. Pierson now announces another variety from the Pierson fern which he calls Tarrytown. Of this he says it is as different from the Pierson fern as that is from the Boston. The small side pinnae are again subdivided, changing the entire character of the fronds, which measure less than half the length and about twice the breadth of the fronds of the Pierson fern. The fronds also assume an entirely different form, the side pinnae standing on edge ratther than flat, as is usual, making both sides of the frond equally beautiful—entirely different from every other fern. The plant is very dwarf, only about half the height of the Pierson fern, and of very much more compact habit.

A variety which has been sent out under the name, Nephrolepis Scotti, originated by John Scott, of Brooklyn, N. Y. He claims that it is the finest commercial fern ever introduced, and the most graceful and symmetrical Nephrolepis known. It makes three times as many fronds as the Boston fern in a given time.

The best of all, however, is the variety elegantissima, many fine plants of which were shown at the late flower shows in San Francisco and Los Angeles. This has more finely divided and more graceful and elegant fronds than any of the several fern section. At present it seems well nigh impossible that any further improvement can be made from variations of the Boston fern.

NEW QUARTERS.

Theo Payne, seedsman and nurseryman has moved into better and permanent quarters at 345 South Main street, where he expects to maintain the choicest lot of flower and vegetable seeds to be found in Southern California.

THEODORE PAYNE
SEEDSMAN AND NURSERYMAN
HAS REMOVED TO
345 SOUTH MAIN STREET
WHERE IN LARGER PERMANENT QUARTERS HE WILL BE PLEASED TO SEE ALL HIS PATRONS

ACACIAS and EUCALYPTI
In variety. Also a large stock of
ROSES, PALMS,
ORNAMENTAL SHRUBS,
VINES, SHADE TREES, Etc

815-817 SANSOME STREET SAN FRANCISCO, CAL.

LIKE HONEY DEW is the HIMALAYA BERRY
Coreless and rich, they literally melt in your mouth—You can have them in your garden at almost no cost

It's black, but not a blackberry. It's a new arrival, from the north slope of the Himalaya mountains. For many centuries the natives of mysterious Tibet have been making wine and cordial of them, and only the recent invasion by British troops of the "Roof of the World," as this quaint land is called, has brought this delightsome, luscious fruit to our civilization.

Enormous clusters of large-sized berries ripen all summer on this bush, making the Himalaya the most productive of any variety known. The flavor is sweet and of unusual richness. They have no core, and when ripe they literally melt in your mouth.

JELLS EASILY

For pies and jellies the Himalaya berry is a perfect success, being ahead of any similar fruit. It jells easily, and either fresh or cooked is good for the sick, being an excellent regulator and having tonic and medicinal properties of unusual virtue.

The severity of their native climate has made the berries hardy, and both the plant and the fruit will stand extremes of heat and cold better than will our domestic fruits.

WILL BE THE FAD

It will be hard for you to realize what a treat is a dish of these new berries. They will be all the fad after they get to be better known and enough are grown in the United States to supply the demand.

Now is the time to plant, and you will have a crop of berries next season. Three bushes will produce all the berries a family can eat.

We have a limited supply of pot-grown roots—hardy plants with lots of fibrous roots—not suckers, but well-grown, well-developed specimens. If you want to be the first in your neighborhood to have Himalaya berries, order now.

PRICE (Prepaid)—Per root, 50c; three for $1.00; per doz., $3.00.

Order now—the supply is limited. Use this coupon:

In the Vegetable Garden

VEGETABLE DISEASES.

The business of growing vegetables and melons, or truck farming as it is commonly called, is rapidly passing into the hands of American gardeners in this country. This means in the majority of cases permanent holdings and intensive farming. One of the natural concomitants of intensive farming is the accumulation of fungous spores and the insidious bacteria that are responsible for the various wilts and blights that prove so destructive both to the crops and also the anticipations of the growers. The past season has been one of widespread prevalence and virulence on the part of the various rusts, mildews and blights, and it is fair to assume that millions of spores have matured in the affected areas and are simply awaiting a favorable opportunity to commence reducing the profit on the next crop.

Any treatment looking to relief from the losses caused by these fungous foes of the gardeners must of a necessity be preventive. Once they have entered the tissues of the plant they are then beyond the reach of any remedy we may apply, and as a general thing when they become apparent to the unaided eye, they have already accomplished the destruction of the affected parts. Prevention consists of totally destroying the spores by fire, or by coating the young plants with a substance which, while harmless to the plant itself, burns off the tender, minute tip which emerges from the spore upon germination.

One of the better means of relief from these troubles—especially so in the case of ground that must be used again for the same purpose—is sanitary measures. The prompt destruction by fire of every particle of debris left of the vines after the crop is gathered, and the most opportune time to do this is now, before the first rains arrive. In the case of melon and tomato vines and asparagus tops, burn them broadcast as they lay; any attempt to rake or pile them up will dislodge myriads of spores which will find safe lodgment in the soil. What is needed is a quick fire that will sweep over the surface destroying the spores without unnecessarily heating the ground. This may be brought about by lightly covering with straw, or better still and perhaps as cheap, by spraying with distillate and firing in the middle of the day.

This treatment while not a panacea for these troubles is the first step towards obtaining practical immunity next season, and in addition will destroy large numbers of injurious insects hibernating in the trash.

—Fred'k Maskew.

GROWING ASPARAGUS ABROAD.

The method of raising asparagus in Germany is described in a report from our Consul at Mannheim. The industry he says, is of importance, especially in Baden, where the soil is a sandy loam. After thorough manuring of the land, the roots are planted at intervals of from 4 to 5 feet, in rows about the same distance apart. No crop is harvested for the first three or four years, and in the meantime the ground is well cultivated and fertilized, preferably with stable manure. During this period the ground is kept hilled up around the plants, and the shoots are cut back until a considerable bunch of strong roots forms at each hill, with fibers running in every direction. In the third or fourth year, early in the spring, the earth is hilled up around each bunch to a height of a foot or more, with a base a yard in diameter.

When the new shoots begin to appear, they are cut off from 5 to 8 inches below the surface. The shoots are entirely white except at the tops; they are tender and of fine flavor, though somewhat larger than in the United States, being one-half of an inch in diameter. About three pounds of shoots are taken from each mound. Replanting a field is thought advisable after the twelfth year, although many tracts have remained without replanting for twenty-five years. The products retail in the spring for 20 cents a round, dropping to 10 cents later in the season.

STRAWBERRY HISTORY.

The story of the origin and evolution of the garden strawberry forms a chapter in the history of economic plants which is of more than ordinary interest to American horticulturists. Although this fruit has been in cultivation nearly 250 years, its origin and history were obscure until within the last decade. Botanists passed the garden strawberry and left it without a name. Horticulturists contented themselves with giving the plant its generic name, Fragaria. During the early nineties Bailey interested himself in the history and development of many of the garden plants, among which he included the strawberry, and as a result of his studies the cultivated strawberry has been assigned to a well-recognized botanical speices, Fragaria Chiloensis.

The plant reached Europe about the year 1712, but attracted little attention and made little progress until about 1750 or 1760, when another berry, having a pleasant, pineapple-like aroma, found its way into Europe under the name of pine, or pine strawberry. This strain produced cultural varieties rapidly and soon gained a wide distribution, gradually replacing sorts previously in cultivation which had come from the scarlet class of North America, the parents of which were Fragaria Virviniana and the everbearing type, Fragaria vesca, which is native to Europe.

During early colonial days the wild strawberries of the field, F. Virginiana and F. Americana were abundant and furnished a much prized article of diet. The plants were transplanted to the garden and gave fruits of increased size, but only a few commercial varieties resulted. Hovey, who may be considered the father of the American strawberry industry, used these native plants along with imported plants of the pine type as the foundation of a number of crosses, which resulted in the production of two varieties, the Hovey and the Boston Pine. Owing to the loss of records the true parentage of these could never be determined. It was Mr. Hovey's opinion that the Hovey sprang from a cross of Mulberry and Keen's seedling, both of the Pine type. The Hovey did for the strawberry what the Cape grape did for viticulture. It formed the main nucleus for the development of commercial sorts, although the scarlet type was long held in high esteem. C. M. Hovey, who is here mentioned, was father of C. H. Hovey, the plantsman, of South Pasadena.

The garden strawberries of this country have come chiefly from the so-called Pine type of berries, which has been probed beyond question to have sprung from Fragaria Chiloensis, a plant originally brought to Europe from Chile, but which is now known to be native to the Western mountain regions of both North and South America. The first native strawberries to be brought under cultivation however, were those of eastern North America, which belong to the scarlet class, the species being known to botanists as Fragaria Virginiana. This class, as has been stated, has contributed only sparingly to our present variety list. The wild berry of Europe, which has always been held in more or less esteem because of its ever-bearing tendencies, has likewise contributed only meagerly to the garden sorts of its native countries and none whatever to the American list. The burden of the industry rests upon the Chilean plant.

The garden strawberry is an American product. It adapts itself to a wider range of latitude and to greater extremes in environment than any other cultivated fruit. It is universally liked and is cosmopolitan in its adaptions.

SOME PICKLES.

Irwindale is becoming a great pickle producing center. We saw many tons of cucumbers delivered to the pickle works and the promise is for more of them another year. This years price has been 75 cents per hundred for the size of 1000 cucumbers to the 100 pounds; $1.25 per hundred for the 2000 size; $1.75 for 3000 size and $2.25 for the 4000 size.

Mr. F. C. McCandless informs us that at those prices fair returns can be had from the land.

A subscriber, Mr. C. F. Lee of Pasadena gives the following sure method of keeping seed beans from weevil: Moisten cloth with carbolic acid and lay on top of beans in glass jar which is sealed.

CURRENT EVENTS.

Orange Harvest Prospects.—Unless the signs materially change Southern California will experience next year a more bountiful crop of oranges than was utilized last season. Last year 26,671 carloards of oranges were shipped to eastern markets. This year the yield promises greater by from five to ten per cent. which will increase the output very considerably. Of course no fixed estimate can be made at this time, because we cannot tell what is before us from a weather point of view. But if no unfavorable conditions occur we are reasonably sure of a bumper crop both of oranges and lemons. Tulare, Butte and other counties in the north are shipping oranges for which they are receiving most satisfactory returns, and it looks now as if California, as a whole, will grow rich out of its product of citrus fruits alone.

Florida will not make the showing credited it a few weeks since, and danger from competition on that score is eliminated to the extent which makes it no longer feared.

Hence the California citrus grower faces the coming season with more than reasonable certainty of an increase in his output. If the prices shall remain as they are the orange and lemon growers of this state will all be past the danger point for years to come, for they can pay their indebtedness, if they have any, improve their holdings and be prepared for any change in conditions in the years to come.

* * *

The Packers' New Deal.—Apparently the meat packers of the great centers have determined to get even with the farmers of the country. Angry at the prosecutions of the government which have been encouraged by the millions of farmers most of whom are cattle raisers, the packers now propose to purchase three millions of acres of land in Wyoming, on which 1,500,000 head of cattle can be run the year around, and to become independent of the cattle growers.

The land belongs to the Union Pacific and is appraised at three dollars an acre. The proposition is one which the cattle growers must meet. They can do so by co-operation, establishing packing plants of their own and disposing of their products through their own resources.

The trouble has always been with farmers and cattle growers that they will not co-operate, they are too widely separated and too indifferent to a community of interests. But now that they are confronted by a dangerous monopoly they will have to get together and present a front which will protect their interests.

The cattle growers can take care of themselves if they will co-operate. They can produce and market their product at reasonably remunerative figures, but they can not stand against the combine of packers unless by a system of co-operation.

* * *

Awaiting the Owens River.—The agriculturists of the San Fernando and San Gabriel valleys are waiting anxiously the settlement of details which will insure to Southern California abundance of water for all time to come The injunction suits started against the ranchers of this broad territory are troubling these farmers not a little, for should they be made permanent this vastly rich country will become a comparative desert and the earnings of a life time will be swept away by the edict of the courts. There is need for immediate and urgent action by the authorities to get this water into Southern California. Millions of dollars of property depend on it.

It is the all important issue of the present. The future of all this southern country depends on the united and energetic work in bringing the Owens River to our land.

* * *

Municipal Ownership.—Municipal ownership has gained a point in Colorado by the statement of the trustees of Silverton for the quarter ending Sept. 30. "Silverton is not the largest city in Colorado, but it is large enough to show what the people can accomplish in the matter of public utilities when they are free to act—not hampered by existing contracts, by courts, poltical cormorants or grafters," says the Denver News. The following figures, taken from the quarterly report of the finance committee of the Board of Trustees of Silverton, shows what municipal ownership of the light and water plants in that town accomplishes: Income from water works for past quarter, $2,205.19. Income from electric light plant for the month of September, $285.98. This latter was the profit from the light plant for a month, when the expenses were $1,188.66. Municipal ownership in Silverton pays all expenses in maintaining local government and there are no local taxes on property in Silverton.

* * *

On the Sun Kissed Trail.—Last month more than 30,000 tourists from the rocky shores of Canada on the north, to Texas on the south, from the shores of the Atlantic and from no-mans-land, rolled, tumbled and slid into California to test the merits of a land so generously advertised as a sanitarium for all the ills which flesh is heir to.

Many of these people have come to stay, say twenty per cent. of them, and the other eighty per cent. will go back East, sell what property they can and return after a while. Just as the rest of us have done in the years gone by. Hundreds of those who have come this week will not live long anywhere. They are consumptives or weaklings who have been pushed away from their Eastern homes because their physicians don't want them to die on their hands. This reminds us that we read in a Los Angeles paper, a few days since, the statement by a Los Angeles physician of the heartless practice of Eastern physicians who send hopeless invalids to Southern California in order to get rid of them. He mentions a particularly harrowing case of this kind, that came under his observation. Commenting theron, this physician says, "while change of climate is sometimes a good thing, no change of climate can possibly be of much avail where people carry erroneous methods of life with them. As to the curing of consumption, if not too far gone, you may cure it anywhere, provided you live in the open air day and night, and eat just as much plain, wholesome food as you can digest and assimilate. The open air life is, of course, far easier in a section like California than it is on the Atlantic coast. The main thing, however, is to see you get pure air, and this cannot be found in any large city."

Nevertheless it is a shameless practice to encourage consumptives, in the last stages of the disease, to come away out here with the hope instilled in their minds that the climate of California will return them health. There is only one place for the sick—and that is home.

* * *

Farmers' Clubs.—Now that we are in the long evenings again, farmers' clubs should take on renewed vigor. They should exist in every township in the State where population will warrant. They will prove of substantial benefit in the social, intellectual, and moral improvement of those numbered among their members and show that the farmers are imbued with the spirit of progressiveness which should prevail on every hand. Wherever these clubs are found there also is the telephone and rural free mail and good roads. They will likewise stimulate the commuuity to ask for a State Institute located at some central point in the county at which a great fund of information will be procured.

* * *

More Water Needed.—Los Angeles and San Francisco are engaged alike in quest of water for the future. Both cities have almost reached the limit of supply and, as yet, have but just begun to awake to the mighty demand which will come, in the not far distant future, from the million or more population which each of these cities will embrace.

Los Angeles has gone two hundred miles into the mountains, and from an inexhaustable supply of pure snow water, will, at a cost of $23,000,000, bring 30,000 miners' inches of water into the city. This will be enough for Los Angeles, when she is a city of a million and a half, and furnish beside, abundant irrigation service for the ranchers in a territiory one hundred miles wide and one hundred miles long.

San Francisco is also going into the mountains for her water. The territory from which this supply will undoubtedly come is close to Lake Tahoe in the higher elevation of the Sierras, where a chain of lakes, about fifty in number, and the American and Cosumnes rivers, will be sufficient to pour 75,000,000 gallons daily of the sweetest water in the world right into San Francisco—a supply now believed to be sufficient for the next two centuries—and at a cost of $38,483,000.

* * *

The Flower Show.—The success of the new Southern California Horticultural Association whose exhibit closed on Saturday in Los Angeles under such auspicious conditions will afford encouragement to the Floral Society of San Francisco, which holds its annual meeting on 9-11 of this month in the grand hall of the Ferry building. These exhibitions of garden beauty will have a most beneficial effect on flower lovers over the State. Tourists who viewed the Los Angeles flower show pronounced it the most beautiful thing of the kind they have ever witnessed while new comers to the State were frequently heard say that one of the main reasons why they desired to come to California is that they may grow a flower garden. A home in this enchanting clime without a flower garden would be indeed incomplete. Half the beauty of living here is in the raising of flowers, and the man or woman who is devoid of this ambition misses to that extent the glory of a California home.

In both the Los Angeles and San Francisco floral exhibits the veteran flower grower will find ample opportunities to gather new suggestions of value, while to beginners will be created an incentive to do their best.

COUNTRY SOLID FOR RATE LAW.

Joseph H. Call of California, member of the committee appointed at the recent railway rate convention in Chicago with the entire committee will shortly call upon the President to present to him resolutions adopted at Chicago.

Mr. Call declares that the vast majority of the people of the country demand legislation that will put into the hands of some administrative body of the government power to correct the evils of existing railway conditions.

"The sentiment of the country unqualifiedly indorses the efforts of the President to secure a remedy for present evils," declared Mr. Call. "I believe the President's plan is one that not only will reduce the oppression now imposed upon the people, but one which will protect the interests of the railroads as well."

If action on this question is postponed by Congress, the Cultivator believes, it will continue to be the issue before the people of the country until Representatives and Senators are elected who will do what the people want.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

The vineyards of Sonoma County will yield but little over half of their usual crop.

A representative of the Cultivator now in San Diego county writes that the olive and lemon orchards between San Diego and the Mexican line are heavier with fruit than any he ever saw.

In order to keep out the Florida White Fly (Aleyrodes Citri), the Governor of this State has ordered a quarantine established against all citrus fruits and citrus nursery stock from that State.

The fruit packing and shipping companies of Redlands are already making extensive preparations for caring for this season's orange crop, which is just now beginning to turn from green to gold. One local company alone is preparing to pack more than 1000 cars of fruit in Southern California this season.

Articles of incorporation have been filed with the County Clerk of Riverside County for the Orange Heights Fruit Association, a Corona corporation. The directors and stockholders are W. C. Barth, J. G. Moore, W. C. Sargent, F. E. Thompson, Jacob Stoner, L. A. Frick and L. R. Nichols, all of Corona.

In one day a packing house at Fowler received 93 3-4 tons of raisins or an equivalent in value of about $8000 and no day in the last three weeks has it received less than 50 tons. It has shipped on an average of three carloads a day during this busy season and it is said that the four local houses together have averaged forty cars per week during that period.

Much damage from rain may result to the walnut crop in Southern California. One of the largest growers in Orange county writes: "If the growers pick up the fallen walnuts at once and dry them on trays they can be saved but if neglected for a day or two the nuts will turn black, mould and crack open. The wind and rain caused most of the walnuts to fall and if it dries up in a few days the crop can be rushed out without delay."

Five acres of cherries are in full bloom on a ranch located near Stony Point, Petaluma county. The sight is a novel one. The trees are black Tartarians. The blossoms are perfect and the trees are heavily laden. Other trees in the orchard are also beginning to put forth blossoms, and it appears as if this entire acreage of fruits will soon be in bloom. The present state of affairs is unheard of previously in this locality.

In Napa, Sonoma, Alameda and Santa Clara counties, which comprise the dry-wine district, there is not more than half of the average yield. The quality is not of a very high standard, owing to the fact that in many districts the grapes are very low in sugar. Reports from the sweet wine districts indicate a considerable shortage, but this crop is of a much better average yield than in the dry-wine districts. In regard to prices, while they may be somewhat firmer, there will not be an advance proportionate to the increase per ton in the price of grapes. Last year prices for grapes ranged from $15 to $17.50 per ton, while this year $17.50 was the minimum price paid, $20 per ton being about the average.

The State Horticultural Commission will issue a monthly circular to the different county commissions throughout the State, containing information, advice or suggestions useful to them in their labors, tending to advance the horticultural interests of the State and to establish uniformity of method and action on the part of the Commissioners, to encourage a closer relationship and to permit the interchange of ideas. A record of quarantine work is also to be made, as well as of observations of fungous or bacterial conditions of trees and plants.

AGRICULTURE.

The shortage in the peanut crop around Orange is greater than at first supposed. It is said to be less than two carloads. Many fields of the nuts not yet gathered will be damaged by the heavy rains.

The harvest of grain is over in the Redlands section and reports show a fair crop to have been secured. The threshers are all back and the amount of grain may now be told with accuracy. In the Yucaipe valley there were 13,100 sacks of barley of 100 pounds each.

A "Cultivator man" writes from the Arroyo Grande: "This has been a good year in this always prosperous valley. Apples, beans and potatoes have yielded beautifully, berries have done well, a good crop of walnuts was of fine quality, dairy and stock interests are thriving.

Over $150,000 was received this year for cantaloupes grown within a radius of eight miles of Thermal. The yield was from 100 to 250 crates per acre, price per crate ran from 70 cents to $1.60. The crates are about one foot square and two feet long, and contain 45 cantaloupes each. In all, over 300 carloads were shipped.

It is reported that C. M. Buck and Frank H. Davis, who recently purchased 400 acres of land southeast of Lindsay, intend to plant a large tract next spring to cucumbers and other vegetables for the manufacture of pickles. They will build a pickle factory and establish a regular business which will be quite an addition to our foothill industries.

In the Beaumont and Banning districts 665,000 sacks of grain were harvested. There were also threshed 25,000 sacks, mostly barley but some wheat, in the Moreno valley. The total amount of grain threshed in the Moreno, Alessandro, Perris and San Jacinto communities was about 150,000 sacks, making a total of 228,100 sacks of grain in the Redlands district.

The chile pepper crop about Anaheim is now being marketed. There is an active demand in Los Angeles for the Anaheim and Yorba crops, buyers offering 14 to 15 cents per pound net for it. The first carload has been moved out over the Santa Fe at 14 cents, which gives the growers a good profit. One grower who only moved out three large sacks as a starter received $130 net.

There were about 16,000 tons of beets from Compton and Cerritos; 2000 from Lynwood Station; 2000 from Watson Station; 1000 from Clearwater and 800 from Patata Station. Making in all 21,800 tons, which averaged high test.

The late rainfall has proved a record breaker in Orange county for this season of the year. For the first two days the rain gauges recorded 2.75 inches. In the Santiago hills east of town and in the El Toro region the precipitation was more than three inches. The moisture comes at an inopportune time for walnut and peanut growers, but otherwise the farmers are accepting the downpour with due thanks.

Ten acres of alfalfa, near Calexico, that was cut for seed and threshed last week, produced 600 pounds of seed per acre. With alfalfa seed going at 16 cents per pound this makes $96 per acre for one crop of seed. In addition to growing a crop of seed any well cared for alfalfa field will produce seven or eight tons of hay per acre besides furnishing splendid pasturage for three or four months during the year.

MISCELLANEOUS.

United States Land Commissioner Daugherty, for Monterey county, announced Thursday that 340,000 acres had been withdrawn from public entry, pending the declaration of a forest reserve.

Extensive forest fires are raging north and east of here. A report from Baker's ranch says that Michigan Bluff is almost surrounded by fire. Wires are down and it is impossible to get particulars. Serious fires are also reported in the neighborhood of Forest Hill.

Robert W. Ayers of the forestry service has arrived from Washington for the purpose of testing eucalypts for fence posts. They will be dipped in boiling creosote which is expected to give them a period of use certainly more than thirty years and perhaps twice as long.

The Los Angeles Chamber of Commerce has compiled a statement of the products returned from the soil in Los Angeles county. Naturally the Dairy belongs to that class and the products are thus summarized in this branch in the report: "There are 600 dairies that produce 730,000 pounds of milk valued at $1,000,000. Of creameries there are 12, producing 2,000,000 pounds of butter, valued at $575,000; 1,000,000 pounds of cheese, valued at $160,000, and 800,000 gallons of cream valued at $584,000.

Nathaniel Ellery, State Highway Commissioner, has returned to Sacramento after an extended absence in Humboldt county and elsewhere. Mr. Ellery has been giving special attention to construction work on the banks of the Eel river, for which an appropriation was made by the last Legislature. He speaks of the work as being of the highest importance. There are now under construction two stretches of 2000 feet each of revetment work and 1000 feet of jetties. Property to the value of $1,500,000 will be protected from inundation by the river in its high stages, while a failure to perform the work would have involved the ruin of 700 acres of the best land in the State.

A BIG FINANCIAL INSTITUTION.

Much comment has been caused in financial and business circles of Southern California during the last few weeks by the announcement that the large and strong First National Bank of Los Angeles had vastly increased its capacity for banking by absorbing two other of the strong and representative institutions of Los Angeles, namely, the Los Angeles National Bank, formerly located at First and Spring Streets and the Southewestern National Bank, located at Second and Broadway.

As noted, the First National was an exceptionally strong institution, prior to this accession and with the increased facilities and force of representative bankers to its directorate now stands as the peer of any bank in the West. In financial strength it is the largest of any bank west of Denver and south of San Francisco.

The officers of the First National Bank are: J. M. Elliott, president; Stoddard Jess, first vice-president; W. C. Patterson, second vice-president; George E. Bittinger, third vice-president; J. S. Cravens, fourth vice-president; W. T. S. Hammond, cashier.

The directors of the bank number thirty-one and will comprise the directors of the three banks entering into the combination, together with H. E. Huntington and Epes Randolph. The names of the gentlemen forming the board are: J. M. Elliott, J. C. Drake, F. Q. Story, C. W. Gates, J. O. Koepfli, Walter J. Trask, H. Jevne, Stoddard Jess, W. T. S. Hammond, Dan Murphy, William M. Van Dyke, W. C. Patterson, H. F. Vollmer, W. E. Hampton, A. H. Naftzger, Frank P. Flint, L. C. McKeeby, C. C. Desmond, G. E. Bittinger, H. C. Witmer, John S. Cravens, E. J. Marshall, George J. Denis, Harry Gray, Gail B. Johnson, John B. Miller, W. M. Garland, Burton E. Green, N. B. Blackstone, H. E. Huntington, Epes Randolph.

The total resources of this institution aggregate over eighteen million dollars. The deposits are thirteen million, five hundred thousand dollars while the capital, surplus and undivided profits are in excess of four million dollars. Some of the stock of the institution has been sold at $400 a share.

These points give something of an idea of the strength and solidity of this institution. Any readers who may have occasion to maintain an account in Los Angeles and who wish absolute security may well correspond with the First National Bank, which promises, and fulfills it, that the small depositor shall have equal courtesies and attention with those who carry a larger account.

THE WESTERN HOMESEEKER.

Out of the supposed "wilds of Montana" there comes to our table one of the brightest, most up-to-date highly illustrated farm periodicals published west of the Mississipi. It fairly teems with matter relating to the vast field in the center of which it is situate and cannot fail to attract to that region many homeseekers who are about to act upon the advice of Horace Greeley and "go West."

The fact that four great Indian reservations are soon to be opened for settlement in that region is immediately responsible for bringing into existence the Western Homeseeker. Published monthly at Missoula, Montana.

C. H. SESSIONS, ASSOCIATE EDITOR

FEEDING VS. BREEDING.

Intelligent feeding has solved more of the vexatious problems in stock breeding than any half-dozen other things; a special plea for a more frequent use of one's good sense in respect to this question is made by E. J. Waterstripe in the Farm and Fireside and in which he says:

"Why is it that so many persist in growing hogs in the same old way—keeping them in a close pen, and feeding them exclusively on corn? Corn is not a growing ration, and hence is unfit for young and growing pigs. Many experiments have shown that corn cannot be fed alone at a profit. Corn is a fattening, and not a growing ration, and what young pigs need is a ration that will form bone and muscle—it will be time enough to attend to the fat later. Corn is the main crop grown in some parts of the country, and of course it seems rather hard for some feeders to get used to feeding a different ration than that of corn, corn and only corn.

"If the farmer cannot do any better, he should at least manage to have a pasture for the hogs to run in. Grass cheapens the gain, as it comes nearer being a natural food for hogs. But when feeding pigs grain they should have something else besides corn. As a test recently made at one of the experiment stations it was found that a much greater gain could be made by feeding middlings and skim milk with the corn. It is impossible for all farmers to feed the milk, but if something on the order of some mill feed were given with the corn it would cheapen the cost of producing a pound of gain. It requires some feed which has a good per cent. of protein to balance the corn and perfect the ration.

"The main point I wish to make is against the feeding of corn exclusively as a ration for hogs. It should be fed exclusively only in the end of the fattening period. It is common sense to feed other grain with corn. Corn makes fat, while food like middlings furnishes material for the flesh and bones. If some food is fed which contains a larger per cent. of protein, the body has a full supply to use in building up all parts of the system. A closer study in feeding all live stock is what is needed, and we must have it for the best results. When I look over the country and see how corn is being fed to horses I wonder how our horses are as good as they are. If the farmers of this country want better horses they must do some better feeding, and do it simply by feeding more liberally of oats. I know by experience that oats makes better horses, and makes them feel better and more like working. The same rule will work with feeding hogs.

"The only way to feed successfully is to study the value of the feed used. The man who feeds hogs with a profit these days must know all these things. If a profit is made by feeding corn alone it will be an exceptional case. When corn is high and hogs seem low a person hardly knows what to do. The only thing left to do is to plan and study, do the best you can, and take the results. Sometimes even the closest feeder will come out in the rear. I think there are more fine points in feeding hogs than all other stock. Don't say there is no money in hogs, but try feeding them more intelligently."

THE BILLY GOAT IS ALL RIGHT.

We note that the esteemed Live Stock and Dairy Journal is moved to make some facetious suggestions concerning the Humboldt county dairymen who recently have imported a carload of "strong smelling William goats" to place among the dairy herds for the purpose of preventing disease among cows.

"For argument's sake," says the Journal, "we will admit that a good strong Billy in good smelling condition would prevent the introduction of most any self-respecting germ, but we cannot help but remember the opinion the "old man" held of the young fellow who continually polluted himself with cheap cologne, that he "must have a pretty strong smell that he wanted to cover up.' They had better take the money spent for the goats and purchase some good disinfectant. They will probably have to do this before they get through—buy double the quantity they would have in the start, for that will be necessary to get rid of the William's reminder.' Nevertheless there is virtue in the "strong smelling" goat, We know so because we have kept him as a disinfectant for years among our dairy and herds in Iowa.

We admit he is a stench maker, that he is a fence knocker, that he is the meanest creature about the farm, but his smell is strong enough to drive away infectious germs and that is why we keep him.

The theory may be "old-fashioned" but it has much in it, as has been repeatedly proven by Iowa farmers when comparison has been made between those who keep "William goats" in their herds, and those who do not. The former having less per cent. of sickness in their herds and a healthier showing of hogs. Old-fashioned theories are not all to be cast aside. Our forefathers had a lot of genuine common sense.

HOW THE COWS ARE CARED FOR IN HOLLAND.

"Holland has often been called the cow's paradise, and it well deserves the name," writes Professor Connor, in the Rural World. "In the care and treatment of their cows the Dutch cannot be surpassed.

"In Holland the cows are turned out to pasture in May, and do not return to the stable until November. During the cold, damp days of early spring they wear blankets in the pasture to protect them from the weather. At milking time they are not driven to the barn to be milked, as is the custom in this country, but instead the milkmaids go to the cows, wherever they may be in the pasture, and carry back the milk, not wishing to give the cows any unnecessary travel. From the time they leave the barn in May until they return in autumn they receive no feed other than grass. During the winter the grain feed consists almost entirely of oil cake, feeding from two to four pounds each day. The principal feed, however, is hay, each cow receiving nearly thirty pounds daily. It takes the great capacity of these cows to handle so large a quantity of hay. The cows are put in the stable in the fall and are not let out again until the following spring. During this time they are given the best of care, scarcely an hour passes day or night that they are not visited by an attendant. They are watered, fed and milked with the greatest regularity and given every comfort possible.

"The Dutch owe their success in no small degree, in establishing so fine a breed of dairy cattle, to the careful selection of their breeding stock. Only a few of the choicest bulls are kept for sires, and the greatest care is also exercised in selecting the females."

PURE-BRED CATTLE.

The use of purebred cattle has greatly increased the interest in farming Farmers who care but little for their scrub cattle find more pleasure in raising pure breeds. This the editor of the Cultivator knows from long experience. With the advent of good stock on the farm comes greater interest in farming, a greater diversity in crops and better cultivation of the soil.

Sharples TUBULAR CREAM SEPARATORS

Will you buy a bad separator because the agent is a "good fellow?" Some people do. They should read this.

If You Have a Brand New Separator

not a Tubular, put it in the garret. **We guarantee Tubulars to make enough more butter than any other separator, and from the same milk, to pay 25 per cent yearly interest on their cost. You test them free side by side.** Your decision is final.

Carnegie is using investments paying 6 per cent; here is a guaranteed 25 per cent to you. The waist low supply can—simple bowl—enclosed, self-oiling gears—are found only on Tubulars. Catalog T 260 explains it.

U. S. SEPARATORS SOLD BY K. B. NORSWING

MAIN ST. AND SLAUSON AVE., LOS ANGELES

Separators can be seen at store, near end of Maple avenue car line.
If you contemplate buying a machine let us show why ours is the simplest, easiest running and most lasting.
Separators can also be seen in operation on nearby dairy farms. Correspondence solicited.

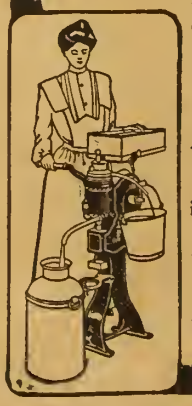
YOUR MONEY BACK - QUICK

5 Cows and a U. S. made $45.00 month
7 Cows but no U. S. made $11.00 month
The U. S. makes the difference $34.00 month

STAUNTON, ILL., SEPT. 25, 1905.

I hereby certify that on April 20th, 1903, I bought of your agent one of your No. 7 U. S. Cream Separators, and after using it for more than two years, I am more than satisfied. In 1902 I sold the milk of my seven cows to the creamery and realized from said cows an average of $11.00 per month. From the herd in the spring of 1903 I sold two of the seven cows and milked the other five, and my income from the five cows was $45.00 per month, a difference of $34.00 in favor of the U. S. Separator. If necessary I will make affidavit as to this statement.

E. D. BRUCE.



Now, how quick did Mr. Bruce get his money back? Well, the *extra* profits alone paid for his U. S. in just about 10 weeks. Many thousands of satisfied users prove the

U. S. CREAM SEPARATOR,
[Which Holds World's Record for Close Skimming

is the most profitable separator a farmer can buy. It does the best work the longest time with least trouble and smallest expense, and it

MODERN DAIRYING A SCIENCE.

Fred J. Eldred, Summit Station, Ohio, at the last meeting of the Ohio Dairymens' Association, said: "Butter making is no longer mere guess work, but it is a science, carried on on scientific priciples. The improvements which go a long way toward making fancy creamery butter possible are:

First. Improvements in the production of milk.

Second. The Babcock test.

Third. Improvements in cream separators.

Fourth. The pasteurization of cream.

Fifth. The use of starters in producing uniform flavor.

Sixth. The alkaline test for acidity.

Seventh. Combined churns.

Eighth. Refrigeration.

The improvements in producing milk can be summed up in the following:

(a) Better equipped and better ventilated barns.

(b) Better and cleaner cans.

(c) Better knowledge of feeding stuffs and their relative values.

(d) The use of the aerator.

The Babcock test has caused improvements in separators, raising the capacity from three to four fold. It has also taught us to save hundreds of thousands of dollars by skimming cleaner and churning more exhaustively. It has given the farmer the idea that he must treat his cows better and take better care of his milk if he expects to have a good test at the factory.

While pasteurizing is not generally practiced, it is, with the addition of the starter afterwards, the means of insuring a good flavored butter where, otherwise, difficulties have been had. Many good buttermakers do not use starters, but it is wise to use one if there is trouble with bad flavor, or to make a more uniform grade of butter.

As for source of starters, one may be obtained from any good milk which has been properly cared for, but a more reliable source is to use a pure culture, which, if properly used, will insure uniform flavored butter. Indeed, there have been many instances where starters have saved the reputation of both buttermaker and creamery when all other means have failed. So I repeat—starters have much to do with making fancy creamery butter.

As it has been demonstrated that cream of certain richness should contain a certain per cent. of acid to produce the best results, the alkaline test has come to be used as a means of telling when cream has reached the proper acidity for churning. While an old buttermaker can tell closely when his cream is ripened properly, his standard may vary some and the Farrington acid test furnishes a standard which will guide him. I think this simple little invention is one of the greatest helps to a modern buttermaker in aiding him to produce a fancy make of butter.

CUTTING UP A HOG.

Now that November, the good old hog killing time is here again we would like to chip in a few suggestions about curing pork for home use. After killing and dressing, the hogs should hang until thoroughly cooled. Operations are usually begun early in the morning so as to have ample time to cool before night. There is greater demand for bacon in this country than for salt pork, hence the sides of all hogs which are not overfat should be converted into bacon. For salt pork, fresh roasts, etc., the hog is first split along the back, the cuts of meat being removed from the loin and shoulder portions and the belly strips used for bacon. When bacon only is desired, the hams and shoulders are first removed, after which the spare ribs are cut away.

Bacon strips about three inches wide are cut around the body, and these are cut in two. The hams and shoulders are cut short of the leg joint, well rounded, and trimmed. Lean trimmings are made into suasage or head cheese. Choice lard is made from leaf lard and trimmings only, second grade lard from gut fat, leaf lard, and trimmings. The hams, shoulders, and bacon are rubbed with salt and placed on edge in layers in a barrel which should first have a layer of salt sprinkled over the bottom. For each 100 pounds of meat make a pickle of ten pounds of salt, two pounds of brown sugar, two ounces of saltpeter, one ounce of red pepper, and from four to four and a half gallons of water. Put these ingredients in an iron or tin vessel, place it over a fire, and boil ten or fifteen minutes. Stir while boiling and remove the scum.

After the brine has cooled pour it over the meat and let it remain from five to six weeks; then remove, drain and wipe the pieces, after which they are ready for the smoke, which should last from two to three weeks. The patent liquid smoke produces meat of good flavor; if cured in the old-fashioned way, the smoke should be kept up constantly, but the meat should not hang near enough to the fire to become heated. The smokehouse must be tight, and it is safer to have a ground floor. The fire should be built in an iron pan near the middle of the building. If a red hot iron is placed in the pan and the corncobs and chips placed over this the smudge will be started easily. An occasional piece of green cottonwood adds to the smoke.

After smoking the hams, shoulders, and bacon, pieces can be sewed up in muslin bags, which are then whitewashed with lime and hung in a dark, cool place. The salt pork is left in the brine until used. It is usually salted more than the hams, and should be placed in a separate barrel made from well-seasoned oak. A stone is placed over the meat to keep it under the brine. In the spring the meat is removed and rinsed in clean water and the barrel scalded. The brine is boiled and the impurities skimmed off. The pork is then put in the clean barrel and the brine poured over it. If this precaution is not taken when warm weather approaches, the grease at the top of the brine will putrify and taint the meat.—Denver Field and Farm.

"How long can I profitably keep a brood sow?" is a question asked by many young breeders. Just as long as she proves profitable, whether that be one year or eight years. Provided she is a profitable brood sow, the litters from an aged sow will be larger and the pigs stronger and more thrifty than those from a young sow.

With reasonably good management, sheep should give greater returns than any other live stock.

If the best profit is realized, not only the wool, but the mutton and the lamb must contribute their part.

SKIMMING STATIONS AND FARM SEPARATORS.

By E. H. Hageman.

Skimming stations have never been thought of very much importance in their relation to the creamery, which seems to me should not be so when we consider that some of the most important work for the welfare of the creamery is done at the skimming station, such as taking and sampling the milk, running the separator and caring for the machinery, and last, but not least, it falls upon the station operator to keep the patrons satisfied and do the missionary work which otherwise is done at the creamery. Since the advent of the farm separator it seems as though the skimming station is destined to become a back number as the former has cut up the milk supply so that in most cases it makes it unprofitable to a creamery to continue skimming stations. As a rule, skimming stations increase the cost of manufacture, and unless at least 5000 pounds of milf is received the station is a drawback and does not pay. We receive better cream from the milk that is skimmed at the station from which we can make better butter than we do from farm separator cream, because the cream is made and skimmed uniform by one machine all under the same condition and the milk must come every morning, but with the farm separator, the farmer makes his own cream, skimmed with twenty or more different separators under the same number of different conditions.

But it costs more to operate the skimming stations and under the present system of marketing butter almost regardless of quality we do not get any more for the butter made from the uniform cream from the skimming station than we do for that made from the farm separator cream. Thus we see that the farm separator man gets just as much for his cream as the one who takes his milk to the skimming station, and with the advantage of having better skim milk and having less bulk to haul to the station, and then with the increased expense of running the skimming station, why should we continue to operate them? But if the butter is sold strictly on grade and keeping quality, then it seems to me it is up to the dairyman to deliver a better grade of cream, otherwise, the prices received for butter may be low enough to more than offset the advantages of the farm separator and skimming station and skimming at the creamery may again come into prominence. I hope the education of the dairymen will come in this way even if grading at the creamery will have to be resorted to, paying full price for nice sweet cream, from 1 cent to 2 cents less for cream too sour to pasteurize, and 3 to 4 cents less for what you might call rotten cream. I believe the skimming station might be done away with, with profit both to the dairymen and creamery if done in the right way without hurting the quality of the butter.

Probably the greatest obstacle to the successful operation of skimming stations lies in the question of getting the right kind of help to run the station, for it takes a good experienced man to handle the machinery, and build up the business among the pat-

CLIFFORD CHEMICAL CO., Manfg. Chemists, 818-820 Maple Avenue, Los Angeles, Cal.

rons. Such a man must also be an expert at the use of the Babcock test and in fact, be capable of managing a good sized business. Now to get a man of such qualifications means that he will be an all-round creamery man and will demand the wages of a person with such qualifications, whether the station gives him sufficient to keep him busy or not. He will not accept small wages, or if he does it will only be until a position in a creamery is offered to him at better wages. On the other hand, a man who is willing to work for small wages such as a skimming station is willing to pay, is in too many cases incompetent to handle the business. This seems to be the greatest drawback to skimming stations.

Skimming stations then must run to full capacity if profitable to the creamery so they can be left in charge of experienced men who can give all their attention to the work, and who understand every detail of testing and other work connected with it, as the former especially is a very important work in the hot valleys. Skimming stations offer the same advantages to the community of dairymen that a creamery does. The money is distributed just the same among patrons and it enhances the value of surrounding land and it seems too bad that they do not appreciate the worth of a skimming station more than they do in some localities and give them support that will run them to full capacity.

REMARKABLE ACCOMPLISHMENT OF THE HOLSTEIN.

President Moore of the Holstein-Friesian Association has given out a statement of results shown at the St. Louis cow demonstration, which tends to throw light on the methods employed by competing associations to secure the awards promised, as well as to put the performances of the Holsteins in better light before the country.

He makes this statement to the press:

"Our herd was hastily collected. We had no great national breeders' association to pay the bills. Economy was necessary. In the selection of our cows the time of their freshening was the prime consideration. Our choice was much restricted by these circumstances. We secured a few fine cows, but the majority were simply pure-bred Holstein-Friesians, without any previous record that promised exceptional excellence.

When the comparisons are made between the performance of this herd and that of the Jersey herd, two things should be borne in mind. First, that the latter consisted of the best Jersey cows in the land, all carefully acclimated and used to the surroundings, and, second, that with alfalfa hay, cut alfalfa and selected ensilage these cows had a great advantage over our herd in the way of roughage. The official report on the first ten-day period shows, however, notwithstanding these disadvantages, an average of 61.5 pounds of milk and 2.05 pounds of butter fat for the Holsteins against 43.8 pounds milk and 1.86 pounds of butter fat for the Jerseys. This was in accord with our private tests preceding the demonstration.

The next ten days we made a daily average of 1.97 pounds butter fat, but during the following twenty days our cows fell off so rapidly that the fourth ten-day period showed a daily average of only 47.1 pounds milk and 1.69 pounds butter fat.

On investigation it was found that the man in charge of our herd had acted in bad faith. He had deliberately unbalanced our ration. Instead of increasing the special daily ration of grains which he knew full well to be necessary at this time, because of our change from a richer to a poorer roughage, he decreased the daily feed of these grains from an average of foureen pounds to less than six pounds.

After his discharge we returned to the old ration and the cows responded instantly. Our daily average rose to 55.29 pounds milk during the fifteenth and to 56.61 pounds milk during the sixteenth ten-day period. But it is an undisputed fact that after a cow is once permitted to run down, the best treatment will not enable her to do her best again during the same period of lactation, and for eighty days of the demonstration we had to contend with this baneful influence, which made it impossible for us to make up for our loss during the thirty days from June 26 to July 25.

That the Holstein-Friesians made as good a record as they did in the face of these tremendous disadvantages is probably due to no small extent to the excellence of the specially prepared ration which was relied upon entirely.

The records of this test put our cows far ahead of all competitors in the production of milk, and solids not fat, and the average daily production of 1,832 pounds butter fat for a period of 129 days by a hastily collected and partly untested herd is under such circumstances, certainly a most remarkable performance, while the production of Shadybrook Gerben, a twelve-year-old cow, which exceeded that of the best Jersey cow, even in butter fat, gives you an idea what a better selected and acclimated herd of the black-and-white cows would have done."

In the dairy districts north of the Tehachapi, the Holstein is the favorite milker. Many of the great dairies of Mendocino, Napa and Sonoma counties use only the Holsteins, but in Southern California, it is claimed better results are gained from Jerseys, which do not require the same amount of feed to give proportionate results.

TO REMOVE WARTS.

C. F. Lee of Pasadena gave us the following recently as a sure cure for warts on cows teats, horses shoulders, a persons hand or any other place. He says it is an old-time remedy but none the less good and sure, and apparently little known.

It is simply the application of castor oil, once a day for ten days, simple, cheap, painless. Try it.

Another homely remedy given by Mr. Lee was for lumps on shoulder of working horses. It was to rub well with a solution of alum or borax in vinegar.

EGYPTIAN VS. INDIAN CORN.

Editor Cultivator: Will you give the relative value for feeding of Egyptian, Kaffir and Indian corn? Also is Indian corn practicable for this country?—W. B. C. Modesto.

The comparative table of the percentage composition of the three cereals is as follows, (Henry "Feeds and Feeding.")

Indian Corn (protein) 10.30, (fiber) 2.20, (starch) 70.40, (fat) 5.00; Egyptian Corn, (protein) 9.96, (fiber) 1.93, (starch) 69.70, (fat) 3.86; Kaffir Corn, (protein) 9.90, (fiber) 1.40, (starch) 74.90, (fat) 3.00.

Experience of feeders generally, has made the conclusion almost certain that no corn excels Indian, in fattening quality, taken measure for measure.

Kaffir Corn requires less moisture, so does Egyptian, but they will not put on fat as rapidly, nor keep the animal in uniform condition on long feeding as Indian Corn will. It is regarded as the best corn extant.

Indian Corn is not as practicable in Southern California as Kaffir or Egyptian because of the climatic conditions existing.

SOME PORTLAND WINNERS.

From the Stockton Independent we note that the Pierce Farm Holsteins are still winning premiums and medals. The manager, W. C. Hunt, has just returned with the stock after a five weeks' trip with three cars of those famous cows at California State fair and at Portland Exposition and he reports that the Pierce stock in competition with the Holstein world, which was represented by four large herds, won 80 per cent. more premiums and 90 per cent. more money than the nearest competitor.

The Pierce stock won at Portland the first prize for an aged herd, consisting of a heifer, a yearling heifer, a 2-year-old heifer, an aged cow three or over, and a bull two years old or over. Another first prize was won for the best young herd, consisting of a bull under two years, two yearling heifers and two heifer calves. Another first prize won was for the best get of a sire, consisting of four animals of either sex. Another first prize was on the produce of the cow, consisting of two animals of either sex. Other first prizes won were for the best bull calf, the best 2-year-old cow and the best 1-year-old cow. Altogether the Pierce herd won thirty-one ribbons and the next nearest competitor was given seventeen.

The famous Juliana De Kol, the cow holding the world's record and the animal sent to the East a year ago to show at the world's fair and later at the convention of the nation's buttermakers held at Chicago, where she was exhibited by Colvin Brown as spokesman for San Joaquin county, was not in the herd sent to the Portland fair because she is resting just now, but her promising son was there and he was a winner. The youngster is under one year of age but he is the best bred animal in the world. He was exhibited in competition at Portland and was given the first prize for a bull calf and won the junior championship for all bulls under two years, coming out of the contest as the champion over all calves and yearling bulls.

Juliana's record in milk is seven gallons a day for 100 consecutive days, so it will be seen that the coming head of the Pierce Stock Farm, the son of Butter Boy and Juliana, will be the record breaking youngster decorated with a California and Oregon first prize ribbon.

Mr. Hunt is one of the best known experts in the handling of Holsteins, having been reared in the business and having owned a $50,000 herd himself, which he sold shortly before coming west last April to take charge of the Pierce Stock Farm. He is therefore competent to judge Holsteins. He says the Pierce herds shown this year in California and Oregon are the best he ever saw, and he bars none in this country or Europe.

MRS. A. BASLEY, ASSOCIATE EDITOR, HOLLYWOOD, CAL.

BIDDY AND THE INCUBATOR.

First we saw in our last talk that in order to compete with "Biddy" the incubator must have fresh eggs, as fresh as if it had stolen a nest like Biddy, that is, eggs not over two weeks old, from vigorous hens mated to an equally vigorous male, one not reduced in vigor by being mated to too many hens, nor underfed.

Having decided upon the kind of eggs that will produce the healthiest and biggest hatch let us consider the incubator that is to be the mother of the chickens. There are a number of excellent standard machines; none are perfect; some have to be watched and regulated night and day, and give as much anxiety as a sick baby. I know it, for I have been through all this trouble and can truly sympathize with Mrs. V. in her anxiety, but there are certain conditions which every kind of incubator demands before filling with eggs.

First, be sure that the incubator is perfectly level. This you cannot discover unless you have a spirit level. Do not be satisfied that because it was level last year it will be so this year. The leg of the incubator on one side may have shrunk or swelled more than on the other during the summer, or the ground may have settled, or the house have been jarred by storm or earthquake; "better be sure than sorry." If the machine is not level the heat will go to the higher side, the temperature will be uneven, and although it may be correct where the thermometer hangs, the upper side will be too hot and the lower side too cool. It is most important to have the incubator stand perfectly level.

* * *

Before starting the incubators test your thermometers. This should be done every season, for thermometers, until they are thoroughly seasoned and two years old, are apt to vary. You can get the thermometers tested at any good drug store or do it yourself. To test them yourself, first borrow your doctor's clinical thermometer, put all your thermometers into a bucket containing at least two quarts of water at a temperature of one hundred and three degrees, keep the water stirred and the bulbs at the same level and as the water cools note carefully the temperature on each, marking on the back, this thermometer half a degree too high, or too low, as the case may be, then mark on the incubator or on a piece of paper, "Thermometer incorrect—run incubator half a degree higher (or lower) than directions." If you have several incubators this plan will greatly assist you and you will make fewer mistakes in the heating.

* * *

Location of the incubator has much to do with the hatch. Ventilation is a most important subject, more especially in this warm climate. In the East, where it is cooler, there is a much more rapid circulation of air, more oxygen is brought into contact with the eggs and the carbonic acid gas is carried away there more rapidly than here. For example, a lady at Tucson wrote me that she was running her incubator with the door of it open, and the lamps not lighted and then it registered too high. Under such conditions there was very little circulation of air, and if the eggs had not been well aired the embryo chick would have smothered or been poisoned by its own carbonic gas emanations and those chicks which hatched would have been weakly, half poisoned little things, beginning their little lives handicapped by the lack of ventilation.

* * *

The incubator should be located in a properly ventilated room, not subject to great variations of temperature. Sixty degrees Fahrenheit should be as near as possible the temperature of the room. The reason for this is that if the room is too cool the air in the incubator will circulate too quickly, which has the effect of drying the eggs too much, whilst if the air in the room is too warm, it will not circulate enough in the incubator, it will be stagnant and the hatch will be poor.

A cellar that is dry and well ventilated, a cellar in which a human being could live and sleep without harm, does admirably for an incubator, but the air must be fresh and sweet, and not smell musty. I have visited poultry ranches in California where there were incubator cellars and in most of them I found the ventilation far from good and many of them were damp and mouldy. In one I found the temperature tolerably even, but the fumes from the lamps and the carbonic acid gas seemed to settle on and around the incubators and poor hatches resulted.

The owner of this cellar had made long ventilating pipes with a large chimney-like opening over each heater and he thought the hatches were somewhat improved by this. The best location then for an incubator is in a room or cellar where the air is pure, and there is but slight variation of temperature. It is also a great advantage to have it in a room nearby where it can be attended to without taking many steps such as up and down cellar stairs, and for this reason I kept most of my incubators in a room adjoining the kitchen, where I could give them a friendly glance occasionally.

* * *

The directions for operating each machine should be followed exactly, as each kind of incubator requires slightly different management, although the general principles are the same. I think in this climate the eggs require more airing and turning to insure a good hatch than in a cooler climate like the Eastern States, and I have found that even Biddy with all her God-given instinct sometimes does not air her eggs sufficiently, "sits too closely," we call it, and has a poor hatch.

Next week I will talk more on incubators and how to operate them.

EDITOR'S QUESTION BOX.

Feeding.—(Mrs. R. A., San Jose). I live on a 60-acre fruit ranch. I have about forty-five old hens (two years) and sixty-five pullets. We feed them five three-pound lard buckets full of Coulson feed in the morning, and the same amount of wheat at night. They have soaked alfalfa leaves, grit oyster shells, and scraps from the table, melon rinds, cabbage (sometimes) potato peelings, etc. The breeds are Minorca, Plymouth Rock, White Leghorns. About a dozen are molting. I get about three or six eggs per day. Now do I feed enough? If not, please give me the rations for that number of chickens. They do not get out and scratch as I think they should. I will be very thankful for any advice you may give. My hens didn't lay well last year. We have a large hen house and about seventy-five roost in that, others in the trees, and some in a small house. My pullets were hatched in April and May. They have plenty of fresh water, but I am afraid we don't feed them enough.

Ansyer.—You do not feed enough. That is the trouble. Weigh your food for one day, then measure what you have weighed, so you may know in weight what your measures hold. Edgar Warren's rule, and he is an authority on getting eggs, is to feed one ounce (weighing it before adding water) to each pound weight of hen. your hens would probably average five pounds each. You have, with pullets, about 110, that is, not counting the males. Your hens would therefore require about thirty-four pounds of food per day and you are giving them less than half that. You are feeding enough to keep them alive but not sufficient to give eggs.

The food goes first toward nourishing the body and supplying the daily waste and after these needs are supplied the balance goes to forming the eggs. Some of your hens are getting sufficient. They probably are the most active or the fighters, and forcibly take the food before some of the weaker and younger can have their rightful share. One great advantage in the dry feed method is that the hens cannot do this; they do not over-feed, either, because they can only take a few beakfuls at a time, and then go to the water and allow the weaken neighbors to get to the food.

Your hens would do much better if separated into colonies of about thirty-five in each, putting each breed as far as possible by itself.

* * *

Ducks.—(J. G. H., Riverside). I have been constrained to buy some ducks, Mammoth White Pekin, and as I know nothing about how to care for them, I write to ask you to please tell me how much and what and how often to feed them. Also regarding water and confinement. I shall greatly appreciate any information you can give me.

Answer.—Owing to absence from home, a reply to yours has been delayed. Rankin, the great authority on Pekin ducks, gives the following formula for feeding:

For breeding birds—Feed three parts wheat bran, one part Quaker oat feed, one part corn meal, five per cent of beef scraps, five per cent of coarse sand, and all the green feed they will eat in the shape of clover cut fine. Feed twice a day.

For laying birds—Equal parts of wheat bran and corn meal, ten per cent of boiled turnips or potatoes, fifteen per cent of cabbage chopped fine, five per cent of beef scraps, five per cent of coarse sand or grit. Keep grit and oyster shells always before them. Also fresh water in drinking vessel deep enough for the ducks to get their nostrils under the water.

* * *

Stubs on Legs.—(Subscriber). We have a pen of White Plymouth Rock cockerels that came from a prize pen. The very best ones have feathers on their legs.

Would you advise me to pull out the feathers and use them with my pullets from the same pens or throw them out entirely?

Answer.—Do not breed from White Plymouth Rocks that have feathers on their legs. "Stubs," as we call them, disqualify the birds in an exhibition. They come from throwing back to the Asiatic ancestors in the Plymouth Rock make-up, but have been so nearly bred out that it is extremely rare to find them, and if you have them to any extent I would not hesitate to say that somehow other blood has got mixed in.

In any case, do not breed from them, remembering that the male is half the pen and that half or more of the progeny will take after him. It depends upon his prepotency and his ancestry. The topic of properly mating and breeding is most interesting Pulling out the feathers would not lessen the danger of their reproduction in the offspring. The only way to lessen the danger would be to have the female more prepotent than the male and unless you are absolutely sure of this it is not worth while running the risk.

* * *

Turkeys.—(Mrs. J. D. W., Sonoma). Your help to others leads me to hope for help also. This is my first experience in raising turkeys. I had eight hatched by a turkey hen last April. I fed chopped fresh alfalfa, green onions, hard-boiled eggs, curds, a little corn meal, charcoal and grit every day until they were four weeks old, then I gave them wheat once a day with the other mixture. After a month old they were allowed to run at will. They grew remarkably. I weighed one gobbler September 4th, when he was 4½ months old and he weighed a trifle over 12 pounds. Toward the latter part of September he seemed lazy and did not care to eat or drink or dust himself, and on watching him I noticed his droppings were white. I put him by himself, gave him asafoetida pills and put carbolic acid in his drinking water. In about a week he died and there was not a speck of flesh on him. He was literally a skeleton. A few days after a turkey hen went the same way. It is over two weeks since she died and now I notice another hen has lost her appetite, although she is still fat and heavy. The feathers are smooth and glossy and the head remains red. Do you think eating grapes would cause it? They had the run of an old vineyard.

Answer.—Give each of your remaining turkeys a liver pill, as large a dose as you would take yourself, then skip a day and give another, for I think it is liver trouble from overeating when young.

It is difficult to diagnose a case when the only symptoms given are that they grow thin and the droppings are white.

You should hold a post mortem examination and find out what is really the trouble or disease. It may be tape worm, or possibly tuberculosis, or liver trouble, or enteritis; if it is the latter (which I do not think it is) the wattles and head would turn dark and the "caeca" be swollen and inflamed. The "caeca" are a part of the bowels like two tubes joined together by a small ribbon of fat (the pancreas). If it is enteritis (something like typhoid in human beings)

When writing advertisers mention Cultivator.

very little can be done to save the affected one, a liver pill and a little sulphur in the food and moving those that are well to new grounds, thoroughly disinfecting the old runs.

Enteritis is a bacterial disease; comes from a microbe either in dirty water, such as soiled by ducks or hogs, and is very infectious, but I think yours is simple liver complaint. Grapes never hurt my turkeys. I kept them in a vineyard for two years and never had finer, bigger turkeys.

DOES PURE-BRED POULTRY PAY?

There is but one answer. It does. It pays in the same proportion as pure bred stock pays.

No live, progressive farmer or stock raiser is content to raise scrub stock of either horses, cattle or hogs; he argues that thoroughbreds fatten better, grow quicker and make better returns for the money invested than scrub stock. The same argument is equally applicable to poultry. Pure-bred poultry develops quicker, fattens faster and weighs heavier, and presents a heavier appearance on the market, whether sold as live or dressed poultry, hence will command a better price. Another point of profit to the owner of pure-bred poultry is that he can usually sell his roosters at a price far above the market price to those of his neighbors who wish to improve their flocks and eggs in hatching season may be sold at an advance on the market price. While the cost of keeping and raising pure-breds is no more than the mongrels, the profits are all in favor of the pure-breds. If there were no profits, the pleasure one derives from seeing a flock of pure-bred birds, so near alike that one cannot tell "which from tother," is so great that once owning the pure-bred, one would with great reluctance go back to the flock of mongrels headed by a common dunghill rooster. I would urge every farmer's wife, for she is generally the poultry raiser on the farm, to resolve that she will raise none but pure-bred poultry; and having so decided, select the breed she thinks best suited to her needs, and by purchasing a few birds, or a few settings of eggs, procure a start, then stick to it in spite of what the neighbors will say, for there is always some one to decry a new venture anyway. Having once started I am sure she will say, as I do, it pays to keep pure-bred poultry on the farm.

SICK CHICKENS.

Many complaints are received from farmers about the half-grown chicks dying apparently without good cause at this time of year. It is hard to get a chick up to a few months of a profitable period and then lose it, but until all who raise poultry learn to fully realize the importance of constantly fighting lice there is likely to be a continuance of trouble. It seems almost safe to say that if one can keep lice out of the poultry house and off of the chicks and fowls there is nothing easier to raise profitably than poultry. The battle against lice should be unceasing.

Skim milk is excellent for laying hens.

October is the month to sell the old hens. Keep only the yearlings and the pullets. The old fowls will bring more money now than later, when the young roosters are being marketed.

RAISING CHICKENS IN EGYPT.

"The Egyptians may be slow and behind the age in some things, but in the science of raising chickens by artificial means I think they could give many other more progressive nations points," is quoted by "Feathered Life" as being the remark of a traveler who had just returned from a visit to Egypt. "For instance," he continues, "near the Pyramids there are some eighteen or twenty rudely-constructed incubating establishments, none of which from the outside look as if they were intended to make money. But on entering one of these hatching concerns, especially if it happens to be early in March, one soon realizes that the simple but extensive arrangements within are capable of turning out between 600,000 and 700,000 chickens a year.

"The incubatories are one-story buildings made of sun-dried bricks, being so arranged that the eggs are laid upon cut straw in racks in rooms around the ovens, which are kept well fired during the hatching season. The outside walls are very thick, and are built so that they retain the heat and the only thermometer used is the blood of the man or boy who attends to the fires. By long practice these men learn how hot the ovens ought to be kept, and they replenish the fires as the weather demands. Only a small amount of fuel is needed, and the temperature of the ovens is about that of 98 degrees above zero. The fires are built up for eight or ten days before the eggs are put in, to thoroughly warm the buildings, and after this they are allowed to go out during the hatching season, which is from March until May. The eggs are turned four times a day while hatching.

"The whole outfit of an establishment which hatches over 400,000 chickens a year does not I was told, cost more than 30 pounds and one man runs the whole machine, keeping the fires, buying and turning the eggs, and selling the chickens. There are in this incubator 12 compartments, each 70 feet long, 60 feet wide and 16 feet high, and each of these compartments will hold 7500 eggs at a time, or 90,000 eggs in all. It produced last year more than 650,000 chickens, and did the work of more than 20,000 hens. The supply of eggs for these incubatories is furnished by farmers living within a radius of 80 miles, and they either receive 5 cents a dozen for their eggs or five young chicks in exchange for every dozen eggs that prove productive. In this way more than 20,000,000 chickens are raised and sold in Egypt annually. The value of this product is estimated to be worth three million dollars.

GIVE PLENTY OF ROOM.

Just at this time, when the young stock begins to come to full size and maturity, there is danger that we are tempted to allow a certain amount of crowding in the hen houses. This should be avoided. It is liable to bring on disease, and it will usually result in rapid multiplication of red mites and other poultry pests. Our way to get relief is to sell off the old hens. The old roosters have, of course, been disposed of long since. If we have any hens of last year's raising, that have proven themselves to be good layers, and are typical specimens of the breed, they are kept over for next season's breeders. We like to have them begin laying in January or early February, so as to give us good eggs for setting that will give the March and April hatched chicks. The young cockerels have mostly been caponized, and been put into a house by themselves where they have a sand covered floor and low perches, but nothing else in the way of furniture. If the ventilation in the house is good, or if the whole front is open, the house being similar to an open shed, it will be sufficient protection for the young birds from the weather, and we can put quite a number in a comparatively small space. Our young pullets are also looked over carefully. Any specimen that is even slightly "off," either in color, or plumage, or shape, or otherwise, is soon disposed of. We want to keep our stock as pure and uniform as possible without running into the "fancy business." What we are after is a good and attractive business flock. We like to have people come and admire our fowls, and to tempt them to call for eggs for hatching. No first-class pullet is ever sold off the place. We want the early pullets for early layers and nothing but a fancy price would tempt us to part with even a single one of our "strictly business" pullets. With the old fowls gone, and the young males placed by themselves, we have again plenty of room for the remaining pullets and yearlings.—Prac. Farmer.

REST FOR THE BREEDERS.

With the breeding season over, give the old fowls intended for future use a summer's outing—turning them out to pasture in a shady grove or among the berry bushes.

Ducks should not be kept longer than two seasons.

Be very careful about damp poultry houses or roup will be the result.

The young geese should have one meal daily, even though they are on grass.

The present climatic conditions are telling on the egg supply. Feed your hens regularly and give them plenty of exercise.

The pullets will lay earlier and do much better if the cockerels are sorted out and yarded by themselves. The cockerels will also fatten quicker.

Grade the eggs before sending them to market, not only as to color, but as to size. Keep the big ones and the little ones at home and never send dirty eggs to market.

Exterminate the vermin by burning sulphur in the poultry house. Be sure that all fowls are outside and the house closed tightly so that none of the good effects are lost.

Watch your hens closely now for the next month. The wet season is at hand and there is liability of their taking cold. Get the cracks in their roosting places stopped to keep out the draught.

Poultry manure should be mixed with ashes or sand, so as to insure more even dispersion, and then spread upon the ground. It is a nitrogenous manure and unless properly cared for in the collection will soon become of no use. It should be mixed with the filler as gathered. Land plaster is, perhaps, the best absorbent to use in this way.

Franklin—Do you mean to say that you are going to take a preacher on your fishing trip?

Penn—Yes; the people will believe him.

General Agricultural Notes

FARMERS AND THE ROADS.

It is a singular fact that the farmers, while the original foes of the bicycles and the movement for good roads, are now the most zealous advocates of this indispensible modern betterment. One cannot blame the farmers for their dislike of the bicyclers, for the latter invaded the quiet rural roads in a new and unheard of way. They demanded the best places on the roads and recognized no rights but their own.

But good roads began to be built. The bicyclers pulled so many wires, they worked so many interests, that good roads began spreading their way through the country in all directions. The bicyclers regarded them as built for their own especial use. They did not go so far as to claim exclusive use, except for bicycle paths, but that they were especially theirs they did not hesitate to conceal. And the farmers used these roads, many of which they had paid for in whole or in part, and found them very good. They found their horses could pull heavier loads with less cost than on the old unmade roads to which they had been accustomed. They awoke to their value, with the true American appreciation of cheapness, and anything that led to cheapness, and the second great factor in the spread of the movement for good roads was enrolled, and enthusiastically enrolled in the good work.

The value of the farmer conversion to the movement has settled the matter for all time. Bicycles may come and go, but the farmer lives on forever. We cannot get on without him, even if we would, and we certainly would not if we could. The farmers' interest being thus assured, there is no reason to look for any lessening of the general interest in good roads. That a good road is expensive to build, that it must be kept in repair, and that it is more or less a source of constant expense, is undoubtedly true; but most people now understand the benefits of good roads, and there is no longer need of arguing for them.—From American Homes and Gardens for November.

WATER IN THE SOIL.

A bulletin of the Michigan Experiment Station says:

A soil may have in it too much water, or it may have too little water, or it may have just the right amount of water for the best germination of seeds and the best growth of plants.

To discuss the management of soils so that they shall hold the most nearly proper amount of moisture for crop production and at the same time retain these amounts as far as possible from unnecessary losses is the object of this bulletin.

When water stands upon the surface for any length of time at any season, or within three feet of the surface during the growing season, the land should be drained, preferably tile drained. When soils take on the appearance and feel of dryness, although they may still contain a measurable amount of moisture, they have reached a point where they will no longer yield moisture to the growing crop.

Capillary moisture is the visible moisture which clings to the walls of the soil grains or remains suspended in the smaller openings between the grains. Capillary moisture does not occupy all the pore space of a normal soil, and therefore leaves room for the entrance of air into the soil. But there may be too much capillary moisture in the soil or too little for the best growing of crops.

The plant obtains all its food excepting carbon, from the soil or through it. In nature all these, excepting a part of the nitrogen, are derived from the soil materials, both mineral and organic, of which they form a part. These foods are dissolved in the soil water, and the water with its dissolved materials is taken in through the roots of the plants and thence conveyed to the leaves, where the food materials are reconstructed and much of the water thrown off into the air. From the leaves the remaining water with the reconstructed foods move out through the plant to the growing parts, where the food is transferred into plant tissue or is stored for future use.

But the food materials in the soil before they can be dissolved by the water must undergo a change by which they are made soluble. Whatever this change may be, water is one of the agents by which it is produced.

Water then is important: 1. In the changing of food plants into soluble form; 2, to dissolve and convey plant food to and into the roots of the plant, 3, to convey plant foods from the roots to the leaves for elaboration; 4, to convey the elaborated foods from the leaves to other parts of the plants for use.

SELECTION OF FERTILIZERS.

To any one who is familiar with either the scientific, or the practical side of the subject of agriculture, it seems as strange to expect a soil to go on supporting plant life year after year, and to yield abundant crops, without being fertilized, as it would be to expect a horse or a man to go on from month to month, working hard, but never eating anything.

Every grape on the vine, every pear on the tree, represents just so much vital matter withdrawn from the soil, and this vital matter, this nitrogen, this potash, this phosphoric acid, must be paid back to the soil if we look for continued abundance.

Any one living in a great fruit producing section, where vines and trees have been in bearing for several years, has but to look around him and note what vineyards and orchards produced the earliest, the largest and the most luscious fruits, and invariably he will find that it is those whose owners have been far-seeing enough to judiciously but nevertheless freely, use high-class fertilizers.

The late, the shrunken fruits, the meager crops, he will find in those vineyards and in those orchards where chance rules, and no attention is paid to the use of fertilizers containing these ingredients, in the proportions demanded by the nature of the crop it is intended to produce.

Phosphoric acid, nitrogen and potash are the absolute essentials of plant life. For the different crops these are required in varying proportions; but to enjoy their full effectiveness the source whence they were derived is a matter of importance. It is a wise adage that you "can't get something for nothing," and the buyer who permits himself to be cajoled into buying trashy material will find, to his cost, that he has made an injudicious and expensive experiment.

The result of years of experiments in this country and in Europe has demonstrated that the greatest economy and the greatest efficiency are simultaneously effected by the use of a good commercial fertilizer, containing all of the ingredients necessary to plant life. Further than this, the source of the ingredients entering into the composition of the commercial fertilizers is a matter of prime importance.

If the ingredients are of organic origin, if the grower's phosphoric acid and nitrogen comes from dissolved bone, from blood and from fish, then he is getting full value for his money, and he will reap the benefit in increased crops and in better qualities of fruit and grain.

When the grower is contemplating the purchase of fertilizer let him investigate the matter. Let him ask the agent who offers it to him "What are the sources of your ingredients?"

If the farmer will use abundantly of high grade fertilizers he will abundantly reap the benefit in an improved condition of the soil, and in an increase in the quantity and quality of his crop.

JOHNSON GRASS.

The Texas legislature has been compelled to pass a law enforcing the killing of the nuisance known as Johnson grass. The railroads are compelled to keep their right of way obsolutely free of it, in order that the grass may not spread to adjoining fields. The Santa Fe railroad engaged the services of a professional grass exterminator, and thus far he has made a success of it. Johnson grass makes a good pasture and good hay, but it is a decided nuisance to the crop raiser, as the more it is plowed up the better it seems to grow.

In our state it is especially a nuisance to the vegetable growing districts and it seems probable that our State Legislature will be called upon to make more stringent and far reaching the existing law relating to this pest.

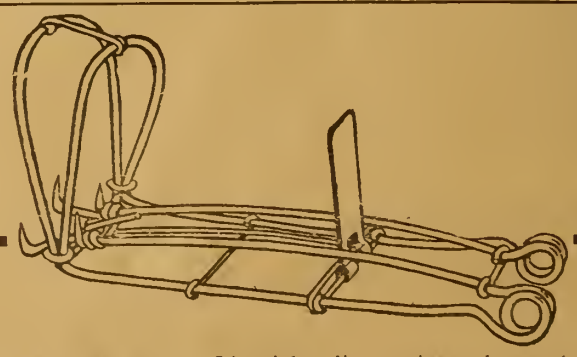
Ask Your Dealer
for the E-Z Gopher Trap
If he won't supply you send 45 cents and your dealer's name and we will send you three sample traps. Best and cheapest trap on earth
J. A. W. GATES, 216-218 West Second St. Los Angeles, Cal.



A GOPHER TRAP THAT KILLS. It's mighty discouraging to buy gopher traps that permit the gopher to escape after the trap has sprung. If you have used other traps you know that gophers crawl or are thrown out of them and the gopher that has been caught and got away will never be caught again. If you would take no chances with traps, you should investigate the merits of the
IMPROVED C. V. 2-RING GOPHER TRAP.
This is a patented trap, embodying all the latest improvements. It is superior to the Single ring, as well as the Clutch and Claw Traps, or the double ring disables the gopher and holds it securely, allowing no possibility of escape.
See that you get the genuine Improved C.V. 2-Ring. Sold everywhere for 25c; or if your dealer does not have them, send us his name and 25c. for sample trap or $2.50 for a dozen, which we will forward postpaid. FALLS MFG. CO., 14 Drumm St., San Francisco.

Queries and Suggestions

NUT GRASS.

Editor Cultivator:—We are having any amount of trouble here with nutgrass or Florida grass. It is almost impossible to get rid of it, it multiplies so rapidly. Some of it has got under my cement head ditch where it cannot be reached. I would like to inquire if crude oil is spread over the ground where the roots are would prevent it from coming up. Yours truly, W. F. McC., Upland.

Crude oil would doubtless kill it, but we believe if coming through sides it would pay to dig down and salt liberally. Use oil sparingly in the ditch and allow to dry somewhat before running water.

CONTROL OF STORM WATERS.

Editor Cultivator: What is the California statute regarding disposal of storm waters in highways?—G. D. L., Gardena.

The law has been construed by the courts in various ways, depending on the conditions which surround the case. In incorporated towns the authorities must care for the excess waters; in the country the Board of Supervisors have this responsibility. We cannot quote the statute at length nor the opinions rendered by the Supreme Court. The general rule is, however, that individuals must care for excess waters, the rule is practically the same with incorporated towns.

HOGS NOT BEST REMEDY.

Editor Cultivator: Will you let me know through the columns of your paper what effect the pasturing of hogs will have upon morning-glory. I have been informed (whether reliably or not I do not know) that hogs will kill out this pest if closely pastured.—W. H. B., Ventura.

Hogs will undoubtedly kill out morning glory but the process would require pasturing for several seasons. The best way to get rid of the pest is to plow it up and burn the vines when dry. A radical remedy for morning glory was published in the Cultivator several weeks ago. Refer to your file for information on the subject.

BLOATING AFTER DRINKING.

Editor Cultivator: I have a driving horse that bloats after feeding if I water after meals. I tried watering before feeding, but my horse won't drink then.

Is there a hard and fast rule about watering horses? If so, what is it?—E. P. G., Anaheim.

No. A hard and fast rule cannot be made to govern all cases. Liverymen usually water before feeding, but this is according to their individual notion which is the better plan. The fact is, much difference of opinion exists among farmers as to whether horses should be watered before, after or during the feeding period. Some claim that it is much better to water them before feeding, while others claim better results are obtained by watering after they have been fed. Quite a number of experiments have been carried on with a view of determining the best method, but it seems to make no difference whether water is given before or after feeding. It is best, however, that whatever course is adopted should be followed. In other words, regularity should be practiced. It is not a good plan to water them before feeding one day and after feeding the next. We should be pleased to hear from our subscribers on this point. But in your case the probable cause of your horse bloating is indigestion. A prescription for this trouble was given by Dr. Oliver in his department about a month ago.

BLACKBERRY PRUNING.

Editor Cultivator: Late last spring I planted some Mammoth Blackberries and they are now trained on wire trellis. What I want to know is, do I cut the canes back to roots or leave them for next year as they are, pinching off new shoots in spring as they appear? I am told this years' wood bears next year's fruit. Please tell me which is right way and oblige. W. B. H., Los Gatos.

If the Mammoth Blackberries were planted in the spring of 1904 and have borne fruit, all old canes should be cut off, as this year's growth bears next year's fruit. I never cut or pinch back new growth but give plenty of irrigation during fruiting period.

I have only found the Dewberry strong enough to bear having all the growth kept down during the fruiting season, after fruiting (the dewberry) I cut off all the vines close to the ground making growth of all the wood for next year's fruit, after spring crop,—W. M. Gray.

LEAF FUNGI.

Editor Cultivator: Would you kindly tell me what is the trouble with my "Leopard Plant;" enclosed find leaf of same. I have it in good earth and keep in the shade and water well, but after the leaves are out a day or so, they begin to dry on the edges, and spoil the appearance of whole plant. If you can give me any information through the columns of your paper I shall be very grateful.—Mrs H. L. D., Stockton.

Put a little fresh lime around your plant, keeping it away from stem, work into soil, after which keep soil dry for a while. The plant is attacked by some fungus caused, no doubt, by a sour condition of the soil.

NON-BEARING ALMONDS.

Will some reader of the Cultivator please tell me why my almond trees don't bear? I have four large thrifty trees, are full of blossoms every spring, but all drop off or nearly all. I haven't pruned them much; is that necessary to make them bear? There are trees within a mile that bear good and not much pruning either. J. R., Fernando.

"The almond has an interesting history in California, but it can be outlined in a few sentences. The importation of the best European varieties began very early, and a number of them had been planted in 1853. They proved irregular bearers, though the trees grew thriftily and in some cases showed fruit very soon after planting. The barren almond trees were largely grafted into prunes or made into firewood and the conclusion was reached that to secure regularity and abundance in fruiting, locations for almond orchards must be sought with the utmost care, and that the secret of success lay in the location. After that local seedlings seemed to demonstrate their value in regular crops, and in characteristics and qualities superior to foreign kinds. Large planting was then undertaken on the ground that the choice of soil and situation, and the selection of trustworthy varieties are both factors of success, but that possibly more lay in the choice of variety than of location. This belief led to wide planting in locations now seen to be unfitted by reason of frosts and at the close of the century the almond acreage is being reduced by cutting out unprofitable trees, and it seems to be fully demonstrated that no matter what variety is chosen, locations for the almond must be selected with great care. It has also been demonstrated that association of varieties promote pollination and satisfactory bearing.

Situations and soils for the almond.—Almonds are now doing best on the higher land in coast valleys, free from fogs and protected from direct winds, but subject to tempered breezes, also at various points in the interior valleys and foothills. The general proposition is that low lands in small valleys should be avoided, and bench or hillside situations preferred, seems to be a safe one. Lands directly upon the coast have not proved satisfactory.

The almond prefers a loose, light, warm soil, and heavy, poorly-drained soils should be avoided. Though they need moisture enough to make good thrifty growth they will produce good crops on soils that are too light or dry to grow satisfactory peaches, apricots, nectarines, cherries, or similar pulpy fruit. The almond is, however, a very deep-rooting tree, and may succeed by reaching deeply for moisture rather than by denying itself, as some think. The tree certainly suffers and is barren from drouth in some cases."—From Wickson's California Fruits.

VETERINARY DEPARTMENT

BY DR. W. J. OLIVER,
318 East Second St., Los Angeles.

To the end that this department may be made as valuable to the subscribers as possible, we ask observance of the following: Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease ap eared. Give your name and address, which will not appear in the paper if you so request. No charge whatever is made for such questions as are answered through the colums of the Cultivator, but when an immediate mail answer is wished Dr. Oliver asks an additional fee of $1.00 and will give immedtate attention and reply by mail. In such case write Dr. W. J. Oliver, 318 E. Second St., Los Angeles, Cal.

Questions should be in by Monday to be answered in the following Friday's paper.

FALL SICKNESS.

Editor Cultivator: Will you kindly tell me what to do for my pigs? When about three weeks old they acted as as though they had caught cold, coughed and sneezed, their mouths got sore and some went blind and died. Others stagger around for some time before they die. Even the most thrifty are affected the same way. We feed the sows in separate pens. Soaked barley is their main food. Kindly advise me at once.

I am at a loss to define the disease or the cause of it, seeing that only the young pigs are affected. Any medicinal treatment would have to be given through the sows. I would advise giving the following so that each sow would get one tablespoonful each feed: sulphate iron pulverized; sulphur; willow charcoal 2 pounds each. Mix.

Waite, Bailey & Lynch, machinery merchants and engineers buy, sell, exchange, repair and install gasoline and steam engines, boilers, air compressors, power pumps, motors, etc. Otto gasoline engines, all sizes, to 200-H. TELL HER SO.

You've a neat little wife at home, John,
As sweet as you wish to see;
As faithful and gentle-hearted,
As fond as wife can be;
A genuine home-loving woman,
Not caring for fuss or show;
She's dearer to you than life, John;
Then kiss her and tell her so.

Your dinners are promptly served, John,
As, likewise, your breakfast and tea;
Your wardrobe is always in order,
With buttons where buttons should be,
Her house is a cozy home nest, John,
A heaven of rest below;
You think she's a rare little treasure;
Then kiss her and tell her so.

She's a good wife and true to you, John,
Let fortune be foul or fair;
Of whatever comes to you, John,
She cheerfully bears her share.
You believe she's a brave, true helper,
And perhaps far more than you know,
It will lighten her end of the load, John,
Just kiss her and tell her so.

There's a cross-road somewhere in life, John,
Where a hand on a guiding stone
Will signal one "over the river,"
And the other must go alone.
Should she reach the last milestone first, John,
'Twill be comfort amid your woe
To know that while loving her here, John,
You kissed her and told her so.
—Selected.

NEVER MISSED THE TRAIN.

The railroad ran along one side of a beautiful valley in the central part of the great state of New York. I stood at the rear end of the train, looking out of the door, when the engineer gave two short, sharp blasts of the steam whistle. The conductor, who had been reading a newspaper in a seat near me, arose, and touching my shoulder, asked if I wanted to see a "real country newsboy." I, of course, answered, "Yes." So we stepped out on the platform of the car. The conductor had folded up his paper in a tight roll, which he held in his right hand, while he stood on a lower step of the car, holding on by the left. I saw him begin to wave the paper just as he swung around a curve in the track, and a neat farm house came in view, 'way off across some open fields. Suddenly the conductor flung the paper off toward the fence by the side of the railroad, and I saw a black shaggy form leap over the fence from the meadow beyond it and alight just where the newspaper, after bouncing along the grass, had fallen beside a tall mullein stalk in the angle of the fence. It was a big, black dog. He stood beside the paper, wagging his tail and watching us as the train moved swiftly away from him when he snatched the paper from the ground in his teeth and, leaping over the fence again, away he went across the fields toward the farm house.

When we last saw him he was a mere black speck, moving over the meadows, and the train rushed through a deep cleft in the hillside and the whole scene passed from our view. "What will he do with the paper," I asked of the tall, young conductor by my side. "Carry it to the folks at the house," he answered. "Is that your home," I inquired. "Yes," he responded: "my father lives there and I send him an afternoon paper by Carlo every day in the way you have seen." "Then they always send the dog when it is time for your train to pass?" "No," said he, "they never send him. He knows when it is train-time and comes over here to meet it of his own accord, rain or shine, summer or winter." "But does not Carlo go to the wrong train sometime?" I asked with considerable curiosity. "Never, sir, he pays no attention to any train but this." "How can a dog tell what time it is, so as to know when to go to meet the train?" I asked again. "That is more than I can tell," answered the conductor; "but he is always here and the engineer whistles to call my attention for fear I should not get out on the platform until we have passed Carlo." "So Carlo keeps watch on the time better than the conductor himself," I remarked, "for the dog does not need to be reminded." The conductor laughed, and I wondered as he walked away who of your friends would be as faithful and watchful all the year 'round as Carlo, who never missed the train, though he could not "tell the time by the clock." —O. A. D.

WHAT WE RECEIVE BY GIVING.

The man or woman who gives cheerfully to good causes and humantarian purposes what he can afford to give, derives therefrom lasting beneficial results. Besides this, it will act as a stimulant to others who have more means to bestow; and your few dollars shall be augmented by other dollars until an endless chain is formed and tight purses shall be opened and hard hearts softened by your example.

Never for one instant allow yourself to fear poverty and dependence. There is a type of so-called generosity which leads to the almshouse. Many a man who is called a "generous, open hearted fellow, who puts his hand in his pocket for every friend," dies bankrupt and homeless. But investigation will prove it is his wastefulness, outside of his generosity which brings the disaster.

Nothing is wasted which we give willingly and lovingly to others, even if we find it was not worthily bestowed for the impulse left its benefit on our lives and characters, but the money spent in show, display and dissipation, in feasting and in extravagant entertaining in a desire to outdo our neighbors, or to make our enemies jealous —that indeed is the waste which leads to want.

Back of each invisible being stands a host of invisibles, and by the nature of your thoughts and desires and ambitions you determine the class of these invisibles who come at bidding to lend countenance and strength to your undertakings.

To each individual at last must be the choosing of his spirit companions. Each and every soul must decide for himself. whether he desires the co-operation of the earth-bound gourmand, drunkard and race-track suicide, the miser and money-hoarder, or the great spirits of light who were the philanthropists and helpers of earth when here.

We choose our unseen companions as we choose our earthly associates, and by the company we keep we are known here and beyond.

Were I the mother of a marriageable daughter, says Ella Wheeler Wilcox, I should hesitate to see her become the wife of a man noted primarily for his economy. The influence of a man upon a woman in matters concerning money is far reaching and subtle. I have known a woman of financial independence and generous proclivities to become utterly transformed by marriage with a man whose one idea of life was the accumulation of money.

And let this mania take root in a nature and it renders it impervious even to the fear of ridicule and scorn of associates; for such a man believes always that in the long run his money will make him a power and bring him the respect he is forfeiting by his petty meannesses along the way.

But this is an error which he either discovers too late or else remains in ignorance of to the end, which is sadder still.

The man or woman who waits until fortune is won to be generous in small matters remains a miser to the end of life. Generosity is a plant which does not grow in a night. It needs cultivating, guiding and pruning. Then its flowers are beautiful.—its fruits precious.

THE BEAUTIFUL DINNER TABLE.

A great many housewives ask the question, how can I arrange my dining room so that my table will show off to the best advantage? If we were to suggest any rule, we would say, arrange your table with simple effect, to exhibit to the best advantage its artistic qualities. Try and collate harmony of colors so that the eyes of your guests may take in at a glance the entire range of the table and its furnishings.

The best rule to follow in table decorations is to aim at simplicity, not to overload a table with ornamentation of any sort and to avoid a sense of confusion.

As a matter of course, the table must be laid with a white and spotless linen tablecloth, glass must be sparkling and silver well polished. It depends on preference whether a center-piece of handsome lace is used.

The choice of flowers for the center is limited only by what may be one's resources. Flowers, leaves or berries that are reasonable are always in good taste. Roses, hyacinths, chrysanthemums, carnations or lilies-of-the-valley are beautiful, care being taken to select one kind of flower and one prevailing color. Flowers with a heavy fragrance should be avoided. A very satisfactory center-piece is a dish of growing ferns. If no flowers or ferns can be obtained, an ornamental piece of silver may do service as a center-piece, or fruit may be massed on a silver dish. A few sprays of fresh and glistening dark-green leaves add to the beauty of the fruit.

Formerly high ornamentations were in vogue but they have gone out of date and are obsolete. Today, low decorations obtain, and bouquets of harmonious colors produce the better effect. The simpler the decorations the more pleasing they are and the more popular.

An important consideration is the lighting of the table. The lights from a chandelier over the table should not be too brilliant, and the more becoming lights will be from shaded single candlesticks placed at regular intervals about the table. Old-fashioned silver candlesticks or candelabra are treasures to be used. The best effects in color may be had by the use of candle shades, the choice being governed by the scheme of color determined on for the occasion: pink shades should be used when pink flowers are chosen; red when decorations are of holly, fruits or scarlet poinsettias; pale green or white when the center-piece is of ferns or of white flowers; pale yellow when the flowers correspond in color, but yellow is considered by some not a becoming evening color scheme.

If a center-piece of flowers is not used and there are no candlesticks or small shaded lamps, a pretty way is to have a few cut flowers in four slender glass vases placed at regular intervals.

There may be two compotiers or dishes holding fruit. Small dishes of silver or cut glass containing bonbons, salted almonds, candied fruit and stuffed prunes may be arranged symmetrically on the table.

It is essential to the attractive appearance of a table that each place shall be arranged evenly and according to the established rule: Three forks at the left, three knives, a soup spoon and an oyster fork at the right, the glasses grouped uniformly at the head of the knives. A place plate, with the napkin folded plainly and a roll within it is laid for each person.

If grape fruit is to be served as a first course, an orange spoon should be at each place at the right, instead of the oyster fork. Oysters on the shell being slightly out of favor at present, grapefruit is the accepted substitute as an appetizer.

Place cards are in good taste when plain white, rather larger and heavier than a visiting card, and with bevelled gilt edges. The name of the guest is written legibly on the card by the hostess, whose duty and pleasure it will be to place the cards and give the last touches to beautify the table before the guests arrive.

"Thank God every morning when you get up that you have something to do that day which must be done whether you like it or not. Being forced to work and forced to do your best, will breed in you temperance and self-control, diligence and strength of will, cheerfulness and content, and a hundred virtues which the idle will never know." —Charles Kingsley.

BURN AIR AND SAVE FUEL

You can do it with the

HAGUE IMPROVED DOMESTIC OIL BURNER

It burns more air than any other burner on the market. Can be fitted to stoves, ranges, furnaces, and all kinds of heating systems. Simplest and most economical burner on the market. If you want the most heat for the least money, write for information to

Hague Domestic Oil Burner Co., 810 So. Spring St., Los Angeles, Cal.

CHILDREN'S TASTE IN READING.

There is a revival of interest in the question of reading for children, as the new reading list for them, published by the Boston Public Library, shows. There was a time, some years ago, when the one requirment for children's books seemed to be abundant pictures. The text might be foolish or false; if the illustrations were taking, the book prospered with young readers. That unhappy state of things has fortunately passed.

A list of questions has recently been sent out to boys and girls in Chicago calling for their opinion in regard to books. About three thousand replies have been received and tabulated. They show conclusively one encouraging fact. The books best liked by children are books which "grown ups" also read with satisfaction.

"Little Women" heads the list, and "Uncle Tom's Cabin," "Robinson Crusoe" and "The Count of Monte Cristo" are high in favor. "Alice in Wonderland," "The Arabian Nights," "Grimm's Fairy Tales," and "Hawthorne's Wonder Book" testify to the perennial reign of the imagination. "Black Beauty" and "David Copperfield," "The Boys of '76," Huckleberry Finn" and "Ivanhoe" show there is variety of taste, and that human interest is potent with the child as with the parent.

It is curious to see "The Lamplighter," that romantic tale of forty years ago, holding its own in face of the arc-light. But a good story defies the assaults of science as of time.

In the hundred books selected by three thousand children, it is surely hopeful to find only a dozen without enough literary merit to commend them to all readers.—Youth's Companion.

CHANCE FOR YOUTHS ON FARMS.

"Bright young men," says James Wilson, Secretary of Agriculture, "are needed in the country. The opportunities offered by the cultivation of the soil seems to be as great as in any other field. So far, however, little effort has been made to overcome the general belief that there is always a large amount of drudgery connected with farming and that the chances are narrow and limited

"Bnt isn't hard toil a necessary condition to farm life?"

"It is hard work to run a farm, very hard work, and always will be. There must be hard work everywhere.

"But times and methods are rapidly changing in all respects. We are entering a transition period, in which cheap wood construction of former years is giving way to permanent structures of stone, concrete and iron. Farm houses, through better water supplies and sanitation, are being made as convenient as those of a city. Moreover, no more significant change is taking place in American agriculture than the extent to which different kinds of motive power are taking the place of men and animals. The use of the traction engine and automobile in the place of the horse on the country roads the employment of gasoline, steam, wind and electric power to operate mowers, threshers, plows, feed cutters, corn huskers and dairy machinery are illustrations of epoch-making changes that are now going on among modern American farms. On one ranch in California there is $60,000 worth of farm machinery operated by some other power than animals or men.

"If a young man with $1000, or perhaps only $500, wanted to become a farmer, where should he go and what should he do?"

"That is an academic question," the Secretary answered. "It takes money to farm. A man can't go anywhere nor do much of anything without capital."

Against the testimony of James Wilson may be put the observations and experiences of David Rankin of Tarkio, Missouri, whose remarkable achievements are often referred to by Secretary Wilson's experts in soils plants, and farm management.

"I just farm," he says, "and pay no attention to science."

Twenty years ago he was poor. Now besides his land, he owns a bank, a telephone company, an electric light plant and a water works. He has given $300,000 to the Tarkio college and large sums to the United Presbyterian church. "The way to succeed," he asserts, "is to hustle. If a man hustles he can borrow all the money he needs." Debt with him, when he is fortified by industry and good sense, is a sign of success."

FURNITURE FOR THE HOME.

Talking with a San Diego farmer's wife, the other day, about the inconvenience housewives have to undergo in doing their work, she made the remark, "men buy the best machinery they can find to do their work, while women skimp along with little or nothing, in the kitchen, and work at great disadvantage."

We could not help acknowledging the truth of this suggestion, but we thought while this lady talked, of what we had read in a reecnt magazine about furnishing the kitchen and the parlor. The writer went on to ask, and we quote here without knowing our authority, if a home cannot be completely furnished throughout, which should be slighted, the parlor or the kitchen? Some one says, "The parlor should come first, of course, for that is where we take our company." Many a home is fashioned after this style. The parlor is well furnished while the kitchen is in dreadful shape, as if the owner thought, "Oh, anything will do in the kitchen."

The mother is the one who has to suffer if just anything is made to do in the kitchen. Did you ever count how many more hours she spends in the kitchen than she does in the parlor? If everything were made convenient in the kitchen, the proportion might be lessened a little. Where there are young people in the family there is double inducement for having the parlor nicely furnished, for they like to have their company; but, even then, it should not be done to the sacrifice of the kitchen.

Kitchen work is tedious and tiresome at best, but much can be done to alleviate the work by having good kitchen furnishings and by having things conveniently arranged. Many who have plenty of cupboards and tables do not have them conveniently placed, so that many extra steps are taken in doing the work. If the household funds are sufficient to get all things necessary and convenient for both parlor and kitchen, all well and good, but a piano and a rickety washing machine do not go well together in the same house. If one is to be skimped, we hope the decision will be made in favor of the kitchen.

THE BOY WHO SHIRKS AND THE BOY WHO WORKS.

There are boys of both kinds in the world, but happily, the boy who shirks is very much in the minority. This is true because the average American boy has too much pluck, too much pride, too much ambition to be classed with the shirks. He may not be able to say in his very heart of hearts that he likes to work, but he can say that he does not propose to be classed with those who "stand around all the day idle," thereby bringing upon himself the deserved contempt of the better class of people in the community.

Every high-spirited boy detests a down-right shirk, and admires the boy or the man who does things—who brings things to pass, and who counts for something because of his own achievements. Every boy of spirit admires the hustler and has contempt for the dawdler. I once went to the funeral of a man seventy-five years of age, and on the way home a man who had known the dead man nearly all of his life said of him:

"There was a man who dawdled away a life that might have been one of splendid achievements, for he was naturally an extremely gifted man, but work he would not, and he shirked everything that he could. His wife supported him by going out as a dressmaker up to the time of her death, and he nearly starved after that. A few of his old friends have to pay his funeral expenses to keep him from being carried to a pauper's grave. A man of good family, respectable enough in morals and of more natural talent than most men, his life has been a flat failure because of his own slothfulness."

I know several boys whose end may be like this if they do not "look a little out." They have good natural ability and good sense enough to know that if they would succeed in life they must pay the price of success, and that is—work.

Never in the history of our country was there a time when there were better opportunities for the boy who is willing to work, and never was competition for the higher places sharper. The shirk and the boy who is looking for a "soft snap" are "dead sure" to be left far behind the eager, alert boy who is so little afraid of hard work that he is not at all anxious to find a "soft snap." The boy who is looking for a "snap" of this kind has in him all the elements of the shirk. I one day overheard two boys speaking about a third boy not long ago, and one said to the other:

"He! Bah! he's a regular jelly fish! Lazy? A snail has more hustle and more muscle than he has or ever will have if he doesn't bestir himself soon!"

Pretty scathing, wasn't it? But people are apt to be scathing when expressing their opinion of the shirk, just as they are apt to be highly laudatory when speaking of the manly boy who is known to be a hustler. Mere inclination has nothing to do with it, boys. Whether you want to or not you must be workers if you ever expect to "amount to anything" in this life. That's the gospel truth.—The American Boy.

Varnish on Furniture.—A scratch which goes no deeper than the varnish on furniture may be healed by holding a redhot poker an inch above it for half a minute. When the place cools rub it well with a mixture of alcohol, olive oil and cider vinegar in equal quantities. This also makes a cheap and excellent furniture polish and will remove white spots from varnished furniture.

VEGETABLES—Tomatoes, per box, 50c@$1.25; Green Peppers, per box, 60@75c; Okra, per box, $1@1.25; Beans, per lb., Green, 5@7c; do Wax, 5@7c; Lima, 5@7c; garden peas, per

lb, 6c; cucumbers, per box, $1@1.50; Summer Squash, per box, $2; Egg Plant, per box, 75c@$1.25; Garlic, per lb, 5½@6c; Marrowfat and Hubbard Squash, per ton, $10@12.50.

POTATOES—Per ctl: River Burbanks, 50@65c; Salinas Burbanks, $1@1.35; Oregon Burbanks, 85c@$1.15; Sweet Potatoes, Merced, $1.40@1.60.

ONIONS—Per sk, Yellow, $1.10@1.20.

Dried Fruits.

DRIED FRUITS—Prices for carload lots, f. o. b. at California common shipping points, in bags, are per lb, as follows:

Apples—Evaporated, fancy, 7¾@8c; choice, 7¼@7½c; standard, 6½@6¾c; Sun Dried, nominal.

Peaches—Crawford, fancy, 9c; choice, 8¼@8½c; standard, 8c; Muirs, fancy, 9½@10c; choice, 8½@9c; standard, 8¼c.

PRUNES—On a 3@4c basis for the four sizes in bags, f. o. b.

Pears—Bartlett, unpeeled halves, fancy, 12c; choice, 9@10c; standard, 7½@8c.

Apricots—Royal, fancy, 9½@10c; choice, 7¾@8½c; standard, 7¼c; Moorpark, fancy, 12c; choice, 8½@10c.

Figs—Per lb., White, 10-lb. bxs, fancy, 60c; choice, 55c; standard, 50c; Layers, 50@65c; bulk, fancy, 4c, choice, 3¼c; standard, 2¾c; ungraded, 3½c.

RAISINS—Crop of 1905, f. o. b. Fresno: Imperial Clusters, $3 per box; Dehesa, do, 5-crown, $2.50; 4-crown, $2; 3-crown, $1.50; 2-crown, $1.40; 4-crown loose Muscatel, 6½c per lb; 3-crown, 6c; 2-crown, 5¾c; Seedless Muscatels, unbleached, 3½c; Sultanas, 4@6c; fancy Seedless, 6½c; fancy Seeded, 16-oz, 7¼c; do, 12-oz, 5⅝c; choice Seeded, 16-oz, 7c; do, 12-oz, 5⅝c; London Layers, 3-crown, $1.50; 2-crown, $1.40; Thompson's Seedless, 6½c; bleached, fancy, 9@10½c; bulk, choice, 8c; standard, 7c.

Honey and Beeswax.

HONEY—New crop, Comb, per lb., 10@12c; Extracted Water White, 6c; Light Amber, 5@5½c; Dark Amber, 3@4c; Hawaiian, 2@2½c.

BEESWAX—Per lb, 26@28c.

Beans and Peas.

BEANS—Prices per ctl: Large White, $2@2.40; small do, $3@3.25; Pea, $3.25@3.75; Lima, $3.40@3.50; common shipping points, $3.20; Red, $3@3.50; Pink, $1.75@2.15; Bayos, $3.50@3.75; Blackeyes, $4.40@4.60; Red Kidney, $3.50@4; Horse Beans, $1.25@1.75.

DRIED PEAS—Prices per ctl: Niles, $1.75@2; Green, $1.75@2.25; Field, $1.50@2.

Live Stock.

Conditions throughout all departments of the Live Stock market are purely a reflection of the features thoroughly reviewed for some time past. Sheep continue in scant supply and rule strong at full quotations and A1 Steers and Lambs snare second place interest at firmly held rates. Calves and Hogs are plentiful at the familiar prices.

CATTLE—No. 1 Steers, 6½@7; second quality, 5½@6c; third quality, 5@5½c; No. 1 Cows and Heifers 5@5¼c; second quality, 4½@5c; third quality, 4c; thin Cows and Heifers, 3@4c; Bulls and Stags, 2@3½c. Prices for all descriptions less 50 per cent shrinkage.

CALVES—Light, per lb, 4¼@4¾c, gross weight; medium, 3¾@4c; heavy, 3½c gross weight.

SHEEP—Per lb: Wethers, No. 1, 3¾@4¼c, gross weight; Ewes, No. 1, 3¼@3¾c, gross weight.

LAMBS—Suckling, $2.75@3.25 per head or 4½@5c per lb., live weight.

HOGS—Per lb.: Hard grain fed, weighing alive 80 to 130 lbs., 5¼c; 130 to 250 lbs, 5½c; 250 to 350 lbs., 5¼c; rough heavy, 4@4¼c; common, 3½@4c.

Hay and Cereals.

HAY—Wheat, choice, $16@16.50 per ton; other grades of Wheat or Wheat and Oats, $11@13.50; Oats, $7@12.50; Stock, 6@7; Alfalfa, $8@10; Straw, per bale, 30@55c.

WHEAT—No. 1 Shipping, per ctl, $1.36¼@1.40; inferior grades, $1.20@1.35; White Milling, good to choice, $1.40@1.43¾, and $1.45 for fancy.

BARLEY—Choice No. 1 Feed, $1.20@1.25; same fancy grades up to $1.26¼; common to fair, $1.15@1.18¾ inferior grades, $1.10@1.13¾; Shipping and Brewing, $1.26¼@1.30; Chevalier, nominal.

OATS—Good to choice White, $1.35@1.45; Red, $1.50@1.62½ for choice to fancy; $1.15@1.32½ for common to fair; black, for seed, $1.60@1.70; lower grades, $1.25@1.55.

RYE—Good to choice, per ctl, nominal; new, $1.45@1.52½.

CORN—Good to choice, per ctl: California, new, large, Yellow, $1.45@1.50; small do, $1.60@1.65; White, $1.40@1.45; Eastern Yellow, $1.40@1.42½; White, $1.40@1.42½; mixed, $1.35@1.40.

CITRUS MARKETS

Citrus.

The new orange crop is beginning to move, but not in quantity sufficient to establish a market. Owing to the elections in many Eastern cities, auctions were not held Tuesday, but Wednesday showed a keen demand for all old crop arriving in good condition. Lemons maintain a strong tone, with light supply.

New York.

One car each of lemons and Valencias offered Monday. Both consisted of choice fruit and prices were firm. Golden Eagle oranges brought $5.45 on an average, while Old Mission brand ran from $6.37 to $7.91, as to grade. Lemons brought $4.69 to $6.90 per box.

Tuesday being election day, no sales took place.

One car of lemons offered Wednesday and averaged $2.74 to $3.43 per box, all the fruit was worth.

Boston.

One carload of Valencias comprised the offering Monday, prices ranging from $3.15 to $6.60 per box.

No citrus fruit offered in Boston since Monday.

Chicago.

Orange offerings fairly liberal Monday, but prices were good, running $2.65 to $6. Lemons brought $4 to $5 per box.

Late Valencias sold Wednesday at $5@6 per box. New Floridas brought $2.65@2.75.

An average of only one orange a week for each of 90,000,000 people would mean an annual consumption of 31,285,700 boxes.

An average consumption by each of these 90,000,000 people of one orange a month would absorb the crop.

TREES IN THE LANDSCAPE.

(Continued from First Page.)

answers many purposes of the manufacturer and cabinet maker. It grows very rapidly, yet has a firm grain and takes a good polish.

Then again for beauty and for use I would plant about the house and in corners and waste lands Mr. Burbank's Royal Hybrid Walnut. Wherever soil and climate are suitable, I would graft it to the best Persian walnuts, but the tree itself, its grace and vigor, its rapidity of growth, the beauty of its foliage and the fine and valuable lumber which it yields makes it a tree to be put first in the list.

When a boy on the old farm in Ohio, I watched through successive summers the airy grace of a tree at the bottom of the meadow, half a mile away, and I have never lost these glorified trees out of the golden weather of the days long gone, and a vision of it comes back as I go up and down in this land so made for beauty, and I wish that I might set some of the quick growing trees I have mentioned about naked homes and graceless ranch buildings and invoke the lavish mood of California seasons to clothe the ugliness with beauty and comfort.

We do not realize, I think, the power of trees to modify the landscape, nor the effect of their cheaply purchased beauty upon the open heart and mind of a child.

In Ulistan it is said that "of the many celebrated trees which the Most High God has created, lofty and umbrageous they call none azad, or free, excepting the cypress, which bears no fruit," and if I could not have an orchard, I would at least have one tree which should be called "azad"—free, fruitless delivered from the work of providing an income, and devoted by its grace to the higher ends of feeding the mind.

It is part of our business to keep the world beautiful, or help to make it so, and haply in some of the prosaic work which has bread and butter for its end, the beautiful and the useful go together. That evergreen grove behind the barn, or growing in some waste land at one side, seen afar across the plain and breaking the skyline with its lofty grace, will yield two crops, one of pleasure and another of profit. Was it Ulysses, who, returning from his wanderings, found his father planting a tree? Happy the man who is not too old to plant a tree. Said the old wise Scotchman: "Be aye planting a tree, Jock; it will be growin' the whiles ye are sleepin'."

FINE BERRY PLANTS.

A stocky plant with a good root is Mr. Frank P. Baldosser's aim in growing berry plants for the trade. He has a few plants of a new introduction, the "A 1" which is said to be one of the best fall producing plants for California. We recently saw his men picking some beauties at his Covina ranch and the plants were well filled with bloom for another crop.

Of Brandywines he has some fine plants from the Kellogg Strain. Of those he has a large quantity.

The Cultivator has recently had several calls for information on the subject of semi-arid cultivation, or Campbell's system of dry farming. In a week or two we hope to discuss this subject intelligently, giving data of interest as well as methods of operation. We cannot do so this week.

During the year there was landed 4,000,000 pounds of fresh fish, worth $200,000, and 800,000 pounds of sardines were packed in addition, the value being $16,000.

IMPROVED LOQUATS

Hardy in all parts of California, the loquat should be more extensively grown, for no fruit we have has been so much improved of late. Those who know only the seedling types have but a faint idea of the great superiority of the Advance, Premier, Victor, and other well recognized standard sorts. Of these the Victor is the largest, is red cheeked, with a deep-colored flesh; the Advance has a pure white flesh and a clear yellow skin; the Premier is the best of all in flavor, but smallest in size. All are vastly superior to the best type of seedlings.

It is rather a wonder that the value of the loquat as a decorative tree has not been more generally recognized; surely when both its fruit and ornamental values are considered, no small tree we have can compare with it. For a tree to plant in the front yard on the farm, where the owner begrudges the space for one purely ornamental, we urge the use of the latest and best varieties of budded loquats in named sorts.

Courtesy Kruckeberg Press

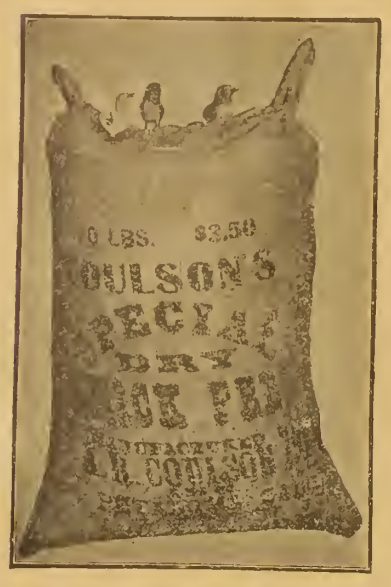
The Advance Loquat (reduced one-half)

$500.00. WHAT ABOUT IT?

Look for a Little Envelope in the 100 Pound Sacks of

Coulson's Special Chick Feed

For Little Chicks and Turkeys



You will have the best success you ever had in raising chickens if you will feed COULSON'S SPECIAL DRY CHICK FEED. Send for sample. It's good for turkeys as well.

This Chick Feed is composed of small pieces of cracked grains, also a variety of seeds and small pieces of charcoal, meat and bone. It therefore contains a variety of the best and most wholesome ingredients in the right proportions to promote the growth of chicks and turkeys and fully nourish them so they will reach maturity early, and be vigorous, strong, healthy birds.

ECONOMY IN USING COULSON'S SPECIAL CHICK FOOD.

By a series of tests it is found that chicks will gain weight much quicker on COULSON'S CHICK FOOD, AND at less cost than those fed on grain.

Chicks fed on COULSON'S CHICK FOOD will reach the weight of two pounds a month sooner than those fed on grains, and they will reach the average weight of three pounds eight weeks sooner.

It is the knowledge acquired through patient study and keen observation which enables us to give the proper feed to poultry in order to raise the largest percentage of the chicks hatched. With COULSON'S SPECIAL DRY CHICK FOOD and COULSON'S GROWING CHICK FOOD many succeed in raising from 95 per cent to 98 per cent of the chicks hatched and you can do as well. TRY IT THIS YEAR.

Mr. Poultryman, there is only one way to buy, and that is, on record of what you want. If you want to raise lots of nice chicks, buy good feed.

COPIES OF LETTERS RECEIVED.

I have fed your Chick Feed since I started this place about September 1st—last—and have sold 3,400 chicks and have 800 on hand now.

A. Mc HORTER.

I like your Special Chick Food better than anything I have ever used.

MRS. GEO. THISSELL, Jr.,
Winters, Cal.

$500. What about it?

I have used your Special Chick Food since last March, and am still using it (July 7th). I believe it to be all right. I have lost less chicks than other years. It is good—the best I ever bought.

R. A. WHITFORD.

I had read so much of your Incubators that I thought I must try one, and I am more than pleased with the one I bought. I have also tried your Chick Food and think it fine. I have to go twenty-two miles to get it.

MRS. MAY LYMAN,
San Bernardino, Cal.

I have used your Special Dry Chick Food and recommend it to all my neighbors.

MRS. IDA L. PARKER,
Eureka, Cal.

I think your Chick Feed is fine. I never lost one while I fed it, and never saw chicks grow so fast in my life.

MRS. HATTIE DEAN,
Mesa, Washington.

Our chicks are doing splendidly on the Special Chick Food. No losses except by accident.

J. HUNTER.

COULSON'S FOODS GIVE BEST RESULTS.

I am a user of Coulson's Chick Food and have raised 1100 chicks this winter. The first hatch I used some other food and lost over sixty. My second I raised on COULSON'S CHICK FOOD, according to directions, and lost only ten. Then in my third hatch I fed COULSON'S CHICK FEED—dry—three times a day for three weeks, and out of 394 chicks, I lost only two, and all are doing fine. Now, chicken raisers in this locality are wondering at my success, and I am praising COULSON'S FOOD as much as I know how. (Signed) F. E. HEUSEL,
Half-Moon Bay, Cal.

We receive much praise for this Special Chick Feed for it pleases the poultrymen and it pleases the chicks.

Many of the large poultry raisers near Petaluma purchase the Special Chick Food by the wagon load.

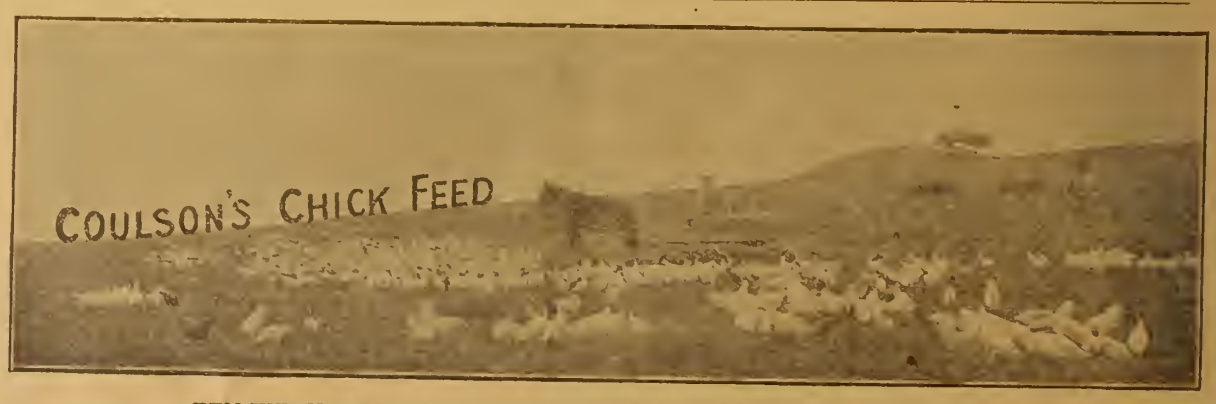
COULSON'S CHICK FOOD

Contains ingredients that long experience in poultry raising has found best adapted to give nourishment to growing chicks. It is promptly digested; causes no indigestion; keeps bowels in normal condition. Chicks show increase in weight, strength and beauty when fed it exclusively. Little chicks need no other food for the first five or six weeks. Save your chicks and make good profits.

Keep them from bowel trouble and all ailments incident to the first five weeks. Profit lies in the chicks you raise to maturity—not in the number hatched. Give them a ration that makes healthy, well developed bodies.

Remember Mr. Bassett sold broilers only six weeks old for $3.75 a dozen. They were fed on Coulson's Chick food

BEGINNING LIFE ON COULSON'S CHICK FOOD.



TEN WEEKS OLD CHICKS RAISED ON COULSON'S CHICK FOOD.

There may be a pleasant surprise in store for you. You will find it in the 100 lb. sacks.

Send me another sack of Coulson's Chick Feed. It seems to be just th thing for young chicks, they are doing fine —H. A. DUN, Tacoma, Wash.

Growing a Vineyard from Cuttings

By Chas. F. Collins, Dinuba

The first thing to do in starting a vineyard from cuttings is to prepare the ground. Most people will tell you to prepare the cuttings first, but after trying both ways I find the former much more successful. It should be plowed not less than one foot deep and thoroughly pulverized. Of course it should never be planted unless a reasonable degree of moisutre is present or can be supplied immediately after planting by irrigation. I consider February or March the best time for planting and in the three different seasons that I have tried it I have always been successful in catching the ground in good condition for plowing and planting at that time.

When the ground is all ready for planting go to a good, thrifty bearing vineyard of the variety desired and secure cuttings from well-ripened short-jointed wood of the former season's growth. These should be made from 12 to 14 inches long. This is better than longer for the reason that if placed in the ground too deep the lower end is in soil that is too cold and often too wet, in the spring, to promote good growth. The lower end should be cut just below a bud. Some say square across but I usually cut mine on the slant and they grow just as well. I prefer the upper end cut just above a bud but it is not necessary for the success of the cutting.

I begin at the butt end of a cane and make cuttings from it as long as the wood is of good size and quality. One very important point which I have known many to overlook is to secure the cuttings from freshly pruned vines. Don't go to brush that has laid in the sun, wind and frost for a week to secure cuttings and expect them to grow for the chances are they will not do so.

When you have cut as many as you need to plant in one day take them to the field you have prepared and either heel them in or throw some wet sacks over them and plant as follows: Take a bucket with about six inches of water in it and fill with cuttings with the large ends down so they will be submerged for about one-half their length. This is the best and most convenient method of carrying them while planting that I know of. Dig a hole with a shovel nearly as deep as the length of the cutting to be planted and then loosen the earth below by forcing the shovel down once or twice and shaking it slightly. I always plant by a wire and dig the side of the hole next to the wire straight by reversing the shovel and forcing it down on that side with the back from me. This saves the time and trouble of digging on both sides of the wire and if the ground has been properly plowed it is all loose as far down as the cutting will extend and does not need shoveling only to make room for the cutting. Now place the cutting against the straight side of the hole in a perpendicular position with the top resting against the wire at the proper point and one bud above the ground. If the buds are close together as they are on the best cuttings it will do no harm if two are above the ground, but never allow more than that. Now fill the hole one-half full of the pulverized, moist earth just taken out. Then with one foot press the earth firmly around the cutting. Don't tramp it as you would in setting a fence post, but press firmly. Then fill the hole with loose earth a little more than level with the surrounding surface and you are ready for the next one.

When done planting, if the ground is moist and well pulverized don't think that because they are cuttings they must be irrigated the next day to start them, neither should you expect them to make vigorous growth without any irrigation all summer, unless you have a piece of land that holds moisture better than the average. On average soil and under average conditions as we find them here it is best to give them a furrow irrigation in a week or two after planting, being careful not to flood as that invariably works an injury. By furrow irrigation I mean running water in furrows between the rows in sufficient quantity and for a sufficient length of time to thoroughly wet the soil around the cuttings by seepage. This will settle the loose earth closely around them. Cultivate well as soon as dry enough and continue doing so at intervals of ten or fifteen days, keeping the weeds down with a hoe where the cultivator will not reach them and you can rest assured that 95 per cent. of them will appreciate it enough to make a vigorous growth.

Several years ago in planting a vineyard of rooted vines I lacked about 1700 roots of enough to fill the ground prepared and was unable to obtain more. It was early in March and I was advised to plant the remainder to corn and fill out with vines the following year. I knew of one vineyard in the neighborhood that was not pruned from which I could obtain cuttings so I concluded to try them and if not successful there would be plenty of time to plant the corn afterwards. Accordingly I made the cuttings from canes in which the sap was flowing quite freely and the buds considerably swollen and set them as I have described and only two out of the 1700 planted failed to grow. I I missed a crop of corn from that patch but had a vineyard of which I was proud and sold fifteen dollars worth of pumpkins from it which I raised between the rows of cuttings. The cuttings were planted March 6th and received one irrigation only, on March 21st and sufficient cultivation to keep the soil in good condition. The rooted vines when planted were very large and vigorous and had the same care throughout as the cuttings but in three years from planting no one could tell the difference in them.

No doubt there are many ways of treating cuttings which will prove as

Vineyard in Sonoma County.

BY J. W. MILLS, POMONA, CAL.

FRENCH PRUNES.

Fifteen or twenty years ago growers made good profits on any grade of French prunes, but like all branches of profitable fruit growing, the business was soon overdone and stagnation followed the wake of prune activity. During the past five or ten years only high grade prunes gave remunerative prices and these were not very profitable. The result was that hundreds of acres were taken out principally in the south end of the State. An improved type of prune was now in demand and several new varieties were introduced.

The Imperial prune seemed to take the lead until Burbank's Sugar Prune came out when it promised to take the lead. However, Imperial seems to hold its own, and is today the largest and most attractive prune that is found on the market in quantities.

The Sugar Prune was disappointing in many respects. It proved to be a slow grower with wood so brittle that it was difficult to handle the crop without great injury to the trees. The fruit is of superior quality but quite difficult to handle. In the south the fruit was rendered worthless by checking and cracking all over the surface before it became fully ripe. Like all fruits, attention must be given to the adaptability of the variety to the different sections. No doubt there are various localities in the State where the Sugar Prune will have few drawbacks and in time will be THE prune for those sections. Imperial Prune will no doubt keep the lead for some time to come.

* * *

Planting the Prune.—The manner of preparing the land for a prune orchard is the same as has been thrashed out in conventions and fruit papers for years past despite the new-fangled methods advocated by Mr. Stringfield.

A good strong peach root system, where the land has good under drainage and plum root where it has not, that spreads a foot or more down and across will beat Mr. Stringfield's stubs in this State. The old-fashioned way of topping the trees all one height and making them start a bunch of limbs at the top has been discarded for the method advocated by Wickson some years ago. It consists in allowing the tree to retain its top when planted, whereupon it will proceed to send out branches as nature intended it should, which is in a spiral form so that the branches will be distributed over a considerable length of the stem and on all sides. This prevents the crowding of branches and makes strong heads that enable the tree to bear heavy loads without breaking. It is hard to estimate in dollars and cents the injury that has been done to the prune groves of the State just because the idea got loose that all orchard trees should be chopped off at a certain height.

Curing Prunes.—When the pricking machine was first introduced, it was thought that dipping in lye for the purpose of cracking the skin could be dispensed with to considerable advantage. It was found, though, that while pricking the prunes hastened drying, it left the prune with a heavy skin which was objected to among the buyers. Dipping in lye gave a thin skin to the finished article and for that reason the lye process is still used even when pricking is practiced.

There are various recipes which have been given for the preparation of a solution into which prunes are dipped before packing. One of the best packers in the State uses prune juice only. The first "dip" is made up of low grade prunes cooked till they fall to pieces. The dried prunes are dipped into this while it is at the boiling point and are then immediately packed in boxes and the lids nailed on when they are ready for shipment. This "prune dip' gives the necessary finishing gloss to the fruit and is absolutely healthful. One important packing house has made a reputation on prunes treated in this manner and is particularly popular with foreign trade in Germany.

The dip above mentioned does not have to be made up occasionally during the season, only water is added to maintain the bulk as the liquid becomes "richer" with increased use. It becomes necessary to remove sediment from the bottom when large quantities of prunes are processed as the dust and grit that is removed from the surface of the fruit by the hot liquid, settles to the bottom. Exhibitors sometimes make a solution of glucose in which to process their prunes so as to give them an extra finished appearance, but there is nothing that will equal a bath of strong alcohol for this purpose, the stronger the alcohol the better.

APPLES FOR THE PACIFIC COAST.

If I were planting an apple or other fruit orchard and desired the best immediate and future results I would seek the best varieties that have originated in that particular region. They are the natural product of the conditions of soil and climate and adapted to their environment. While we know of no limit in the direction of improvement nature makes no mistakes in its constant effort to produce the best under the conditions. The conditions of soil and climate may be but local, or of small extent in some sections; in others extending over a wide territory. Sometimes we find similar conditions in a well defined and continuous zone-like belt, modified in sections by other influences, or may be broken into different divisions, but a general adaptation recognized throughout its limits. To understand these local modifying influences and their effect is, or should be, the first step in all horticultural effort. What we so often of late see referred to as "the great Ozark apple region" is really but a section of the great belt that, beginning in the Appalachian region of the East, cut off by the warmer climate influence of the Mississippi reappearing in the Ozarks and extends like a widening delta, broken in places by the higher ridges of the Rockies to the Pacific where it is deflected by the peculiar coast influences far to the north into British Columbia.

And now, for the second problem presented, "the modification in form and color of those apples when moved from the middle west to the northwest." That there is a decided modification in the size, often in the form and color and other characteristics is becoming well known, and in most of the varieties, the change is in the line of improvement—size larger, color brighter, form more robust and when grown under proper conditions, with a quality that cannot be excelled. The abundant rainfall of the winter months or irrigation when scanty, in sections where our finest apples are grown and the almost cloudless sunshine of the summer, combined with the rich, deep soil gives them a new development. The genial environment found in their new home seems to give them greater productivness and add a new life to their latent powers.

The growth and development of each succeeding generation, if under improved conditions is likely to show something of the potentiality of the generations before. New power of development, new beauties, new varieties are produced, and as the apple is taken on westward through the valleys and mesas of the Rockies and into the more genial climate of the Pacific Coast, what more natural than to expect a development of its higher qualities?

I am not forgetting the apple region of New England, New York and parts of Canada, of its production of such grand old worthies as the Baldwin, R. I. Greening, Newton and the Spitzenberg. The northeastern conditions seem to be peculiar to that section and the new varieties that have had their origin in the middle west show but little influence from that source. The Ozark apple came with the migration westward from Virginia, North Carolina and that southern section of the eastern apple region and nearly all show the typical character. The improvement under the newer conditions has been wonderful. What may be the final result in the farther west as new varieties are produced from the blending of the different life strains as they are now mingling here from almost every source can as yet scarcely be predicted, but as so many varieties, not only from the middle west but from other localities grow to such fine development here, we have reasons to hope for some new creations that will be an honor to this shore of the newest New World.—Frank Femmons, Home Orchard, Cal.

In every California vegetable garden there ought to be leeks growing the whole year. It is no trouble to have them, as they grow easily anywhere. When the plants are about pencil size transplant them in rows about a foot apart and six inches in the row.

BEES IN EUROPE.

The beekeeper, especially in the British Isles, cannot hope to gain a living from his bees alone, and so beekeeping is usually—always, in fact—tacked on to some other business. The very frequent rains and cold, damp atmosphere, makes the business precarious. The nectar produced by the flowers is lessened and the bees are restrained from gathering. Thus there are very few large apiaries in Great Britain, almost no specialists, and so the art is not advanced as in America nor are the methods anywhere near as perfect. I am told that there is but one person in all the country that depends solely upon his bees for a livelihood, and his results are far from encouraging. Yet there are many bees on the islands. The hard struggle for food and raiment leads men to search in all, or any direction that promises gain. Thus there are a swarm of small beekeepers, each with a few colonies of bees, which as the years go by give a little toward the support of their owner. Of course the art cannot advance under such conditions, as it will with us, where a single beekeeper will often ship honey by the carload.

* * *

BEES IN INTENSIVE AGRICULTURE.

It is often preached in America that Europe is far ahead of us in the productivity of her agriculture. It is said that the European farmer practices "intensive agriculture," I believe. This statement will bear examination, I believe. We of California are away ahead of Europe in our methods and results. We have far more brainy farmers, and I have seen no such evidence of thought and study in Europe as I see everywhere about us at home. In one respect Europe may eclipse us—and she certainly does surpass many localities in our country in this regard. In Europe there is no prejudice even in the greatest fruit regions, against bees. As I stated above, the number of small beekeepers is great, and so the number of bees everywhere is surprisingly large. There is no question but that bees are of tremendous importance in the work of cross polinating the flowers of very many of our most valued orchard, field and garden crops. In Europe, everywhere, this work is well done to the great gain of the producer. I have made as close a study as I could while here, and I see no other evidence of superiority in methods and work.

* * *

EUROPEAN MARKETS.

I have been surprised to find so many kinds of California fruits in Europe. We have found apples, pears, prunes, plums, and even peaches, here, still in the boxes of the California orchardists. Indeed, the best pears, prunes and plums that we have secured have been from our own State. I attended an auction sale in Covent Garden, London, and was delighted with the appearance of the plums, apples and pears from our own California. These were not only fine in appearance, but were evidently appreciated as the lively bidding and high prices gave quick evidence. The auctioneer took pains to make it clear that the fruit was from California, which fact in itself was significant. We have been pained at the very high price of fruit in all sections of Europe that we have visited. Surely the poor people, and this means the great mass of the citizenship, can rarely ever more than look upon the tempting apple or pear. It seems very probable that with more pains to develop it there will be a splendid and remunerative market for very much of our California fruit over the seas. This will be more true when the canal is completed.

* * *

ORANGES IN EUROPE.

I was rather late to study the orange market in England, though I am told that our navels are highly appreciated. I did see a few Valencias, but only a very few. Surely if plums and prunes can be safely and profitably marketed in London, Paris and Berlin, then why not oranges? I feel sure that we shall have a field in Europe for much of our citrus fruits as well as for the best shipping deciduous fruits. The work was well begun and may wisely be pushed with fullest vigor to our own benefit and that of the purchasers.

* * *

EXHIBITIONS.

It was our pleasure to attend, while in Edinborough, one of the finest exhibitions of fruits and flowers that it has ever been my privilege to visit. It was that of the Royal Chaldonian Society. Of course we in California could distance them in variety and quality of fruit, but in floral display, great as are our possibilities, we could not measure up with our British cousins. The orchids, especially, were wondrous beyond compare. The grouping and arrangement were most admirable, and surely the educative effect of such an exhibition must be most excellent. The judges had made their examination and given their decision before the exhibition opened. Thus as visitors came to the various exhibits, they could at once see what was the judgment of experts in reference to the comparative merits of the fruits and flowers, and so the educative effect of the exhibition was not a little enhanced.

Farm Lands in Kings and Tulare Counties

Unsurpassed for raising Alfalfa, Hay and Seed, and for raising and fattening Hogs, Cattle, Horses and Mules. Corn, Wheat, Grapes and Deciduous Fruits produce immense crops and large profits.

SOIL

The soil is a rich sedimentary deposit composed of tule roots, shells and silt left by the receding waters of Tulare Lake which many years ago covered these lands.

WATER SUPPLY

Sub-irrigated at about 9 feet. In one of the best Artesian Belts in the State. Fine water for stock and domestic purposes at from 35 to 65 feet. Almost an inexhaustible pumping supply at 80 to 150 feet.

PROFITS FOLLOW IMPROVEMENTS

Several Hundred Thousand Dollars now being expended on our lands for improvements.

Seven rigs now boring artesian wells.

Three steam plows turning 82 furrows and large gangs of teams now plowing and cultivating on our lands.

Thousands of acres now being prepared for planting to orchards, vineyards, alfalfa and grain.

For particulars see

Fine alfalfa lands $30 per acre and up. Larger tracts $15 per acre and up. Easy terms. Liberal rebates for immediate improvements.

Wanted—Practical experienced farmers who fully understand alfalfa and fruit raising, to rent tracts of 40 to 160 acres. Liberal terms. Outside work can be secured while crops are growing. Must have teams and implements or some means. Houses and barns furnished.

Special excursion next Tuesday night. About one-half fare.

Sorghum Cane Molasses

By F. B. Pettengill, Burbank

Making sorghum molasses requires, like making butter and many other good things, the greatest care and good judgment if we would excel the common "rif-raff" of stuff commonly called sorghum. We must not only consider the method of handling the cane and its products after it is delivered at the mill, but must see that the cane has been planted in proper soil, properly cultivated and carefully harvested.

Choose a light, warm soil; new land is best. Particularly avoid a black bottom land, or land recently manured. The young cane should have water enough to give it a vigorous growth, but when it approaches full size use water sparingly for all the extra water must be evaporated and that is expensive and injures the grade of the molasses, sometimes seriously. When the cane is headed and in bloom, take the corn knife and cut off all heads except a few hills here and there, or enough for seed; if you care to save any.

The hills that are not cut back tells when the cane is ready to be harvested.

When the seed left on the "pilot" hills, is thoroughly ripe, take the stripping knife, (made of wood and shaped like a corn knife and long enough to reach the tops of the standing hills) and with smart down stroke of the blade close to the stalks, all leaves and new heads will be removed in short order. Now the cane is ready to cut. Do not cut too close to the ground.

Leave at least one joint on the stump and be careful not to let the ends of the stalks touch the ground, for dirt will stick to them and perhaps finds its way into the molasses.

The mill is usually a three-roller affair, one large and two small rollers; the two small ones running against the large one. This gives the cane two squeezes at one operation. The last roller must be set up tight enough to get the last drop of sap that can be squeezed out, and this lest drop is the sweetest of all.

The sap should run through a strainer as it leaves the mill, pass into a vat or a barrel, and by a pipe to the evaporator. Have the evaporator enough below the mill that the sap will run by gravity if possible.

Now the evaporator can be any size to suit the acreage planted, and the one horse outfit can turn out as fine a product as a ten thousand dollar plant.

There are three important points to be considered in the evaporator; first there must be from six to eight inches on each side that is not over the fire and will always be below the boiling point. This causes the scum to retreat to this cool surface as fast as it raises, from which place it is removed with the skimmer. Any scum that stays on the boiling sap will be broken up and the essence of all the impurities will remain in the molasses.

Second: The evaporator must be so arranged that no mixing can take place between sap of one density and that of any other density. This is best done by having partitions or ledges about eight inches apart running from each side alternately, and ending the same distance from the sides. That makes a continuous channel back and forth across the pan. The sap starts at one end as it leaves the faucet in the pipe, and leaves as molasses at the other. The sap must start on its journey from the hottest toward the coolest end of the evaporator, as the molasses requires less heat than the fresh sap. There is little danger of getting the sap too hot, but when nearly finished 228 degrees F. is about the highest temperature it should go.

Third: There should be gates or regulating slides in one or more places that the flow through the pan may be regulated.

In the near future I hope to describe the method of constructing the furnace and the management of the entire plant.

Waite, Bailey & Lynch, machinery merchants and engineers buy, sell, exchange, repair and install gasoline and steam engines, boilers, air compressors, power pumps, motors, etc. Otto gasoline engines, all sizes, to 200-H. P., better built, more economical, therefore superior to all others; prices and terms that will insure due consideration. See us and be convinced. Office and manufactory, 943-945 N. Main st., corner Bruno st., Los Angeles, Calif.

Los Angeles, California

CLIMATE AND CROP REPORT

U. S. Department of Agriculture, Climate and Crop Bulletin of the Weather Bureau, California section, for the week ending Monday, Nov. 13.

Clear weather prevailed during the week in the central and northern sections, with occasional fogs in the coast districts. In the interior the days were warm and nights cool. In Southern California the rain noted at the close of the preceding week continued at intervals until Wednesday and was followed by warm and clear weather. The precipitations in the south varied from about two inches along the coast to over five inches in the foothill and mountain districts. Light to heavy frosts occurred in the central and northern parts of the State, but caused no damage.

Rain is badly needed in all sections except the south. The soil is too dry in most places for profitable working, pasturage is scarce and cattle are showing the lack of feed. Dairy interests are suffering and stock raisers fear the drouth will last so long that grass will not get a start before cold weather commences. Many of the large mines in the Sierra have been compelled to suspend operations on account of the scarcity of water and hundreds of men have been thrown out of employment. In Southern California the rainfall was quite general and was of the greatest benefit to farmers, orchardists and stock raisers. Plowing and seeding are progressing and the acreage in grain will be larger than usual. Pasturage is already showing much improvement and cattle are doing well. The large reservoirs show considerable increase in depth of water.

Oranges in all sections are coloring rapidly and satisfactorily, and the outlook is good for a large crop of excellent quality. Orange picking and shipping are in progress except where the fruit is always late in maturing. Walnuts and olives are yielding fair crops.

* * *

Eureka Summary.—Long continued drouth decidedly unfavorable for dairy interests; ground too dry to plow; feed too short to do stock much good; water wells and creeks very low.

* * *

Los Angeles Summary.—Last week's rain was unusually heavy in the southern section and much lighter in the northern. It started vegetation and the first sown grain is coming up; also put ground in condition for working, except in some places where too wet.

"I am going to get married and settle down."

"Yes?"

"Yes; and I want you to fix up some flowers in an appropriate design, something big and symbolical."

"How would a big anchor do?"—Boston Globe.

CITRUS FRUITS

By C. A. Day, Pasadena

JAMAICA ORANGES.

Jamaica oranges have been shipped to Seattle and San Francisco, and are on sale at these points. The shipment to San Francisco was infected with purple scale.

Through the courtesy of Exchange officials of Los Angeles the writer had an opportunity to inspect samples of this infected fruit. The sale of this infected fruit in San Francisco may not endanger the citrus industry of Central California, provided it is not reshipped to other points in the citrus section of the state. It simply shows the possibility of the introduction of new insect pests into a locality by the means of infected fruit In the case of oranges wrapped in paper and packed in boxes, it is impossible to determine what insect pests may be located on individual specimens of the fruit.

In times past Los Angeles County has had a little experience with infected oranges shipped into the county from San Francisco. There is always danger from scale infection in the sale of citrus fruit in the local markets of the citrus sections of the state. As a safeguard against the possible introduction of insect pests into a locality there should be a close inspection of fruit sold at the fruit stands and stores and by peddlers. The latter are the most dangerous for the reason that in many cases these peddlers deal in a low grade of goods, fruit that because of infection could not be sold at the stores and fruit stands.

The fruit inspector finds it hard to keep track of these fruit peddlers as they are constantly on the move and have no stationary place of business, as a result a load of infected fruit may be partially or wholly sold out before detection.

* * *

Treatment for Scale Insects.—The main season for fumigation and spraying is nearly over, and this would seem to be the proper time to review the work of this year. With every year there are new phases of the problem of insect control that are presented to the fruit grower, and from each year's experience new and valuable lessons are learned. In very many cases the mistakes of former years are repeated by the careless fumigator or sprayer, and the rubbing-in process has to be repeated a time or two before the lesson is thoroughly learned.

Injury to Oranges from Fumigation.—There is always danger of injury to fruit or tree by the application of almost any kind of treatment for the eradication of insect pests, but with experience and proper care the chance of injury may be reduced to a minimum.

Several reports have come in, of injury to oranges from fumigation. The injury is on the side of the tree where the pots are placed. Investigation shows that fine cyanide was used. Fine cyanide, even with an increase of water, generates the gas quickly. The effect is to pit mark the fruit and in extreme cases burns what the fumigators call a chimney, up through the tree directly over the pots. The leaves are dropped and in some cases the wood is killed. The only thing to be said about this is to never use the fine pulverized cyanide, always use the lump cyanide. The scarcity of cyanide during this season has induced some fumigators to use an article that has evidently been kept over from last year. Some complaint has been made about inferior or low grade acid. The white acid is the best and should be used in preference to the dark colored acid. In fumigation the quality of the material used should be carefully considered. Very frequently injury is the result of the tree being out of condition and the leaves will drop or the fumigating is done in the day time or when the foliage is wet with dew or an insufficient quantity of water is used, resulting in a too quick generation of the gas and burned foliage and fruit.

Experience should teach the careful fumigator to avoid these mistakes, Successful fumigation depends upon a careful estimate of the dosage and measuring of the material. Many of our best fumigators measure the water instead of guessing at the quantity to be used.

* * *

Fumigation of Purple Scale.—Inspector C. C. Bemis of Covina, working under the direction of the Horticultural Commission of Los Angeles County has made a series of experiments in fumigation for purple scale, dating back to the month of January, 1905. It will do no harm to now state that Mr. Bemis discovered over 20 infections of purple scale scattered through the orchards of Covina, these infections each consisted of from one to three trees and was well established on each tree.

The experiments began with increasing the dose to 50 and then 75 per cent. in the hopes of destroying the eggs under the old scale and thus totally eradicating the pest. The increase to 75 per cent. did not do the work and a double dose was then tried and was successful, without injuring fruit or trees,

For the double dose the amount of water was increased to 6 to 1 of the acid. We are informed that the horticultural commission of Orange county has reported to the State Commission of successful work on purple scale with the double dose repeated or two fumigations, but Mr. Bemis finds this is not necessary as one fumigation with a double dose destroys both scale and eggs. This discovery is a very important one as it now will be possible to eradicate this scale pest. The purple scale only infests citrus trees and for this reason it will be more easily eradicated than the red and black scale, which infests a great variety of plants, shrubs and trees.

* * *

Effect of Treatment on the Scale.—In fumigation the increase in the quantity of water used has made the treatment more effective on the scale without endangering the fruit or tree.

In spraying thick topped trees where the branches lay on top of each other, some of the scale are liable to escape the effect of the spray. Another thing, through carelessness on the part of the operator, all parts of the tree are not thoroughly wet and some of the scale thus escape.

A careless or inexperienced person should never be allowed the privilege of applying distillate spray to citrus trees. Distillates carrying heavy oils should not be used. Oil is a poison to plants when used in sufficient quantity, therefore the quantity used should be carefully gauged and condition of the tree considered.

Yellow Scale.—In some localities the parasite for the yellow scale is not effective and treatment becomes necessary to keep it down.

SPRAYING A LARGE ACREAGE

Requires the very best hand pumps, or what is still more economical, a Power Sprayer. More economical because it costs but forty five cents for three days labor and the resulting work is thoroughly done. The grower equipped with a BEAN POWER SPRAYER has little to fear in the way of insect pests or fungus diseases. You know that it often means the saving of a large part of the crop to be able to get over your orchard as quickly and thoroughly, as you can

WITH A BEAN POWER SPRAYER

They are powerful but simple, and no previous experience of any kind is required for operating them. The perfect agitation, the high, even pressure, and the surprisingly large amount of work that can be accomplished daily at small expense are among the reasons for their constantly increasing sale.
Then, too, the gasoline engine can be removed in a few moments, and is always found handy for other purposes, You will agree with all who have seen them that the use of BEAN POWER SPRAYERS

RESULTS IN A CLEAN CROP AT SMALL EXPENSE

Just now, before the rush season comes on, we have a special offer which will interest you. Write today for our free illustrated catalogue No. 18, which explains all the advantages of BEAN POWER SPRAYERS. State acreage and kind of fruit (Catalogue No. 16 describes hand pumps.) Address

Bean Spray Pump Co , 161 W. Santa Clara St., San Jose, Cal.

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

PLANT NOVELTIES OF MERIT.

At the late flower show in Los Angeles there was a cup offered for the most valuable plant novelty. This cup was awarded to the exhibitor of a new crimson flowered tobacco (Nicotiana Sanderae) but many other plants of value were shown in competition.

The Southern California Acclimatizing Association of Santa Barbara sent four plants of unusual interest. One, a new bamboo (Arundinaria Hookeriana) was noted in these columns but two or three weeks ago. Feijoa Sellowiana, a delicious marketable fruit, doubtless hardy in all parts of this State, was written of early last spring. A fine large plant is now fruiting at W. Scott Way's, Altadena. A new Tecoma (T. Reginae Sabae) was shown, hailing from Rhodesia, Africa. As is seen by the specific name, this plant was named for Queen Sheba. It has lately been discovered that her ancient kingdom was in what is now Rhodesia and this vine was found growing over the ruins of an ancient temple. This shrubby climber somewhat resembles T McKenni in foliage and flower, though more ornamental in both. Its chief merit, however, lies in the fact that it is a winter bloomer which makes it a particularly valuable plant for this coast, and no doubt it will prove hardy in all parts of California. The writer saw it in bloom in the month of of January and can recommend it as a valuable addition to our already long list of climbers.

The fourth plant in the Franceschi collection was a giant leaved "Elephant's ear," a new species of Xanthosoma from Nuevo Leon, Mexico. This is the most strikingly handsome aroid ever seen in this or a similar climate and will certainly prove a faborite in our nearly frostless sections.

EMBELLISHMENT OF RURAL SCHOOL GROUNDS.

The greatest need and greatest opportunity for beautifying school grounds is in village and rural districts. And alas! too often there is only bleakness and barrenness. The school directors seem to have set apart the poorest ground in the district for the school yard. Will nothing grow? There are no flowers, and only some weak native weeds and grasses, and a few starved trees. By a little effort these unattractive surroundings could be made pleasant and beautiful. Children should be led to study nature's method, and to examine her manner of planting flowers beside the road, grouping trees and shrubs along fences. The wind, the birds and the squirrels—nature's agents—have no regularity in their seed planting. The arrangement is irregular massing of her trees, shrubs and flowers, and their struggle for existence produces pleasing variety and effective results all the year round.

As was suggested in a recent number of the Cultivator, the school yards might be the breathing spots for the citizens during the long summer vacations and summer evenings, thus forming a stronger bond of sympathy and interest between the school and parents. The children are happier and their work more efficient when they are in daily contact with beautiful school grounds; the cultivated taste and appreciation of the beautiful finds expression in improvement of home conditions, thus making the school a radiating center for civic improvement.

REPORTED NEW INSECTICIDE.

The Electrical Magazine recently describes a series of experiments for destroying injurious insects, which is said to have promised success. An engineer in Monaco while operating an electrical machine in the open air observed that metal rods inserted in the ground and connected with a dynamo of 110 volts, induced insects in the vicinity to leave their hiding places and to come hastily to the surface. Following these observations, a series of experiments was conducted of which full details are not yet known.

An apparatus is mentioned, invented by a Russian, for killing injurious insects by electricity. A dynamo is so placed upon a hand car that no electricity in engendered while the car is standing still. When in motion the current enters the ground through the iron wheel of the car on one side, and upon the other through the points of brushes of copper wire, which are fastened in the rear of the car so as to be a few inches above the ground.

The result is said to be that all insects in the vicinity of the copper brushes are killed as if by lightning.

WILD FLOWERS.

It would be indeed a hard matter to find a person who does not love wild flowers as furnished by nature's garden. Many nurserymen now make a specialty of growing certain varieties of these flowers, which are known to do well under cultivation, and some varieties have become so scarce in the east, through a willful misappreciation of the value of them, that much will depend upon the success of cultivation if they are to be perpetuated, as they have become all but extinct in their wild state.

BILLBOARDS EVERYWHERE.

The large, obnoxious display billboard has invaded the country as well as the city and we hope to see, in the near future, a concerted effort to remove this nuisance from our rural landscape. It has really become a downright nuisance, detrimental in every way to improvement efforts, and with no way of counteracting its influence except by blinding it with planting effects or demolishing it. Every good citizen should lend a hand to redeem our rural communities from the billboard and similar advertising methods; it is a first necessary step in the general work of beautifying our whole State, and should be vigorously prosecuted.

The best cork comes from Algeria. There are 2,500,000 acres of cork forests in that country. Some attempts have been made toward testing the possibilities of cork growing in California. The State University has planted a large number of trees for the purpose of watching their growth and the development of the corky bark. The oak from which cork is obtained in an unusually fine ornamental tree and thrives in all parts of the State.

A NEW CALIFORNIA SWEET PEA.

California has for several years past taken the lead in the growing of sweet peas for seed, and whole trainloads have been shipped out of this State. Starting with the best of the Eckford and other noted strains, the California growers have produced such a marvelous race in the best types that any new pea sent out from this State is assured a hearty welcome the world over.

C. C. Morse & Co., of San Francisco, are this season sending out a bright blue mottled on white, of fine broad, open form, which has been said by those who have seen it to be the brightest blue in its mottlings of any sweet pea ever offered. It is not alone in colorings that the latest types excel. The flowers are large, open, and come in greater numbers on each stem than the older type, while the individual flower stems are much longer. As California now leads the world in sweet peas, "Helen Pierce," the latest candidate for public favor, is sure of a warm reception.

THE COMPOST HEAP.

Every farmer appreciates a good vegetable garden. One of the helps in this work is the compost heap, which every farm and garden should have so as to take care of the refuse or organic matter about the place. A good place for the compost heap is where there is no standing water; also a location where it is handy to get at. On this place all refuse matter that collects in and about the garden, such material as straw, manure, rotten vegetables, fallen leaves, etc. Turn the heap over occasionally.

Worthless or diseased plants should not be given room in any place and simply indicate a careless or ignorant owner. For the sake of appearance and thrift, have none but vigorous, well-kept plants in your collection.

A NATIONAL PARK.

The people of Pacific Grove, Monterey and vicinity are eager to have the 340,000 acres of land that is withdrawn from entry converted into a national park by the Federal government. The land in the main is very rough, but it is valuable as a watershed, furnishing the supply for many small rivers from which Pacific Grove, Monterey and Del Monte obtain water. Professor Dudley of Stanford University is one of the leaders in the movement.

Put fresh cut carnations in water in a cool room. The stems will stiffen and the flowers will stand shipment and rough usage much better than where they are picked and packed at once.

"Ma!"
"What is it now?"
"I wanna nothher pieca cake!"
"No, Tommy, You've had enough."
"Aw, ma! Yer always tellin' me I don't eat properly, an' nen you don't never gimme no chance to practise!"
—Cleveland Leader.

In the Vegetable Garden

CULTIVATING RASPBERRIES.

Clean cultivation is necessary with the red raspberries because they are themselves of a weedy nature, and, in order to hold them within bounds, implements which cut all the superfluous shoots and root sprouts from the cultivated area should be used. During the early life of the plantation it will be found most economical to keep the plants in check rows so that cultivation by horse power can be accomplished in two directions. Later, however, as the plantation grows older, it will be found advantageous both in yield of fruit and for economy, to allow the plants to form a hedge or matted row, and to practice cultivation in one direction only. The spaces between the hedges should be plowed at least once each year. Whether this shall be done in the spring or in the fall will depend upon the locality.

In most instances, however, because of the high altitude and latitude in which this plant thrives, spring plowing will be found to be the most advantageous, as less injury to the roots will result from deep culture at this season. The remaining cultivation should be done with an implement which stirs the surface of the soil only to the depth of two to three inches, so as not to interfere with the young feeding roots which spread through the soil loosened by the plow. Clean cultivation is equally desiralbe for the black raspberry as for the red raspberry, because weeds between the rows interfere with the latter operations in the berry field. While cultivation should not be carried on so late in the season as to interfere with the harvesting of the fruit, it should be sufficiently thorough and continued late enough to keep the ground free from weeds.—Prof. L. C. Corebtt.

A DISEASE OF ALL OUR VEGETABLES.

A bacterial disease of cauliflower and kindred plants is reported as doing great injury in the gardens in some sections. A bulletin from the Ontario Experimental Farm dates the appearance of it from 1901. The bulletin treats only of the course the disease takes, the method of determining the cause of the trouble, the means of natural and artificial inoculation, and the various degrees of susceptibility of the many varieties tested, these varieties being those commonly grown by market and private gardeners. Nothing is said of preventive or check measures. The records of observation show, that humid atmosphere favored rapid growth of the organism on the exterior of the plants, also of that which caused the softening and destruction of the pulp tissues; that, not only growing plants but freshly gathered vegetables could be inoculated, and not only those of the cabbage tribe, but potatoes, celery, green and ripe tomatoes, Jerusalem artichokes, asparagus, rhubarb and onions. Conditions favorable to the growth and spread are warm, moist weather; rank growth with foliage shading the ground and thus conserving moisture; insect pests, especially the cabbage worm; bruising in cultivating; heavy winds causing leaves to be broken and thus affording an inlet in the field, and using the same ground year after year without regard to its being infected with the germs left in the debris.

REMEDY FOR CELERY BLIGHT.

Celery blight can be controlled by spraying with ammoniacal carbonate of copper. To make this, dissolve three ounces copper carbonate in a pint of ammonia, and add 25 gallons water. To wake copper carbonate, dissolve 5 pounds copper sulphate (blue vitriol) in 5 gallons water, also 6 pounds carbonate of soda in 5 gallons water. Mix the solutions slowly, stirring well. Let the mixture stand until next day to settle, after which pour off the liquid. Pour on 10 gallons water, let stand until next day, and repeat the operation, after which strain and dry the blue powder, which is the copper carbonate.

CAPER CULTURE.

The caper of commerce is the pickled flower bud of a shrub that grows in Southern Europe. The business of raising capers for the market might well be taken up in California, the arid lands of the Southwest, and some of the Southern States. In all parts of California this shrub makes a phenominal growth and aside from its commercial value, it is highly ornamental, having fine large white flowers from one to two inches across. The U: S. sends thousands of dollars to Europe every year for capers which should be kept at home.

EVERBEARING SEEDLESS BLACKBERRY.

Last spring there appeared in the columns of the Cultivator an advertisement of a berry under the above name of which we should like to learn more. If such a berry should prove a success it would prove a priceless boon to both berry growers and berry eaters. Who has grown it?

OKRA PODS.

The Okra is a very prolific bearer the seed pods being cut when they are young and tender and cut up into short sections for soup greens. The seed pods when mature are about six or eight inches long, but should be cut before they harden to be satisfactory. The plants reach a size of three or four feet high and are of sturdy upright growth, the blossom being conspicuous and quite pretty.

ENDIVE.

Sow some seeds of endive and when the plants are of good size cover them with straw, hay or sacking. You have perhaps, no idea how nice they are in salad when thus bleached and made tender by covering. They will grow on any soil and require no care beyond keeping them clean of weeds.

PREPARING SEEDBEDS.

The most important step in seed growing, as well as gardening, where transplanting is a necessity, is in the direction of securing healthy plants. Without vitality in the young plant it is absolutely impossible to develop a seed-bearing plant or to secure a good vegetable. A common and fatal error, the one that costs the seed grower more than all other mistakes combined, lies in the preparation of the seedbed, which is almost invariably made too rich, and in many instances, it would be safe to say most, too little attention is paid in its preparation.

The soil of the seedbed should be made as fine as it is possible to make it, no matter what its character may be, and there should not be any fertilizer, either commercial or from the compost heap applied. The young plant, like all other infant forms, cannot assimilate strong food; any food that stimulates the young plant makes size instead of strength. They grow succulent without sufficient vitality to withstand the shock occasioned by removal, consequently they receive a check from which they never recover.

The best soil for the seedbed is one that has been left in good condition after a previous year's crop; it matters but little what that may have been, provided the crop was not weeds, and that the crop was had been kept clean, which would not permit of a weed ripening its seeds. Such a soil is sufficiently rich for the growing of any class of plants for a field or garden crop.

The location of the bed should, as far as possible, be an isolated one, as near the center of the field, where there is a free circulation of air, and where the sun has full force the entire day. But what is more important, have it away from the hedge rows or fences, the breeding places of all insect forms, the enemies of the young plants. The situation, too, should be a dry one, that is, one where there is a good drainage, and where it is impossible for water to stand. While all plants require water, there is nothing more injurious to them than water in too great quantities. Soil that has a tendency to bake is the poorest possible for a seedbed.

CURRENT EVENTS.

Give the Cultivator Your Ideas.—The Cultivator is a paper the publication of which is, in part, to educate the people on subjects pertaining to agriculture in many of its branches. It is not expected that the editors shall know everything about California and its possibilities, nor be able to advise fully on the hundred and one things people differ over in propagating plant and animal life, but, in general, the truth is sought to be given or no suggestion is advanced.

Now there are many well informed people in California who have a liberal fund of information which they have obtained by experience. It covers a range of subjects and is valuable. It is from these persons we desire to hear. They will encourage others who are beginning to make homes in the State, they will promote the good of community by stating what they know based on actual experiments they have made. In horticulture, gardening, dairying and in household affairs very much may be learned by comparing notes. Hence it is that we invite brief discussions on all interesting topics covered by the Cultivator. We may not use them all, but probably we shall, and if they are good enough to publish some one is going to be benefited by them. Let us hear from more of our constituents.

* * *

The President Endorsed.—Mr. J. H. Call, a delegate to the Chicago rail road rate convention, returned from the East with the strong convictions that the country is behind Mr. Roosevelt in his attitude on his railroad rate recommendations. Wherever he went, through the Middle West, he found the sentiment substantially unanimous in favor of the President's views.

The recent election in New York and Ohio strongly indicates the temper of the American people regarding the efforts of a few railroad interests to control legislation, and a desire practically, to administer the affairs of the government. In Ohio, the Foraker machine, which strongly antagonized the president and his railroad policy, has been defeated by 50,000 votes, whereas Roosevelt carried the same State by 250,000 majority at the last presidential election. This was the first time the people had an opportunity to express themselves and it was a rebuke to the machine whose significance cannot be mistaken.

That the President intends to stand firmly by his convictions of what is right in the matter of granting the Interstate Commerce Commission power to fix rates of transportation is the united opinion of all who have conversed with him on the subject. F. G. Story, president of the California Fruit Growers' Exchange, in an interview with Roosevelt, reports him as saying that all he wants is the support of the representatives of California in Congress and especially the votes of our Senators.

SEMI-ARID CULTIVATION.

The subject embraced under the above title is so large and contains so many ramifications, that it can not be covered in one writing.

We desire in this number to present some data bearing on the question of dry farming as set forth in Bulletin No. 103 of the Colorado Agricultural Experiment Station, as prepared by Professor W. H. Olin, who designates his discussion "thorough tillage." This bulletin not only covers the experiments carried on at the Agricultural College at Fort Collins, but includes also such data as Professor Olin was able to obtain through correspondence with other experiment stations in Western states.

The underlying principle of the plan known as the Campbell system of dry farming of which much inquiry is being made in Southern California, consists in conserving all the moisture which falls in rain by thorough preparation and consequent vigilant tillage of the soil.

This is no new discovery nor is it one which any man of this country can lay claim as having originated. Two centuries ago Jethro Tull said: "Tillage is manure!"

Ex-Secretary Morton, who was in Mr. Cleveland's cabinet, whose home was in Nebraska, twenty years ago urged the farmers of that arid state to plow deep, thoroughly pulverize the soil and cultivate the corn rows "until stalks have grown so high that further cultivation is impossible." His theory was, like Robert's Fertility, that frequent stirring and turning the soil is the one fundimental all-essential proposition of agriculture.

* * *

The deeper the plowing the greater the soil reservoir. Experiments conducted at the Cornell experiment station, New York, by Dr. Roberts show that an acre of average soil in good tillth will hold 20 to 25 per cent. of moisture and not be too moist for cultivation. It is estimated that an acre of soil twelve inches deep will weigh 1800 tons if it contains 20 per cent. of moisture, 1620 tons if it contains 8 per cent. of moisture—the amount upon which plants are able to grow and maintain themselves. Dr. Roberts says that an inch of rainfall brings to each acre 113 7-16 tons of water. If this could all be retained in average soil it would mean almost 7 3-5 per cent. moisture, nearly enough to maintain plant growth. Well-fined soil is capable of taking up two inches of rainfall in the first foot of soil and still be in good condition to cultivate Suppose that this soil is deeply plowed and contains 15 per cent. moisture; an inch or two inch rain would find the soil reservoir able to hold it. If this ground were shallow plowed, say four inches, an inch rain would saturate the reservoir, while a two-inch rain would overflow the soil reservoir, causing a loss of water and severe washing away of the surface soil. Deep plowing, therefore increases the storage capacity of moisture in our soils from which the plant draws as it has need.

Harrowing should follow as near after the plow as possible, to prevent loss of moisture. Each half day's plowing should be harrowed the same half day in which it is plowed. Experiments conducted by experiment stations and by Mr. H. W. Campbell, known as the promoter of dry farming show that disking grain ground after the harvester prevents loss of moisture on stubble ground through too rapid evaporation, and prepares the ground for the ready absorption of rain.

* * *

Mr. Campbell asserts, from actual experience, that 20 percent. of moisture can be saved to crops by this system of thorough and deep tillage. He has devised a series of farm implements, ploughs, harrows, disks, etc., to carry on the various stages of cultivation which are adapted to conservation of moisture.

In the Colorado Bulletin Professor Olin calls attention to certain varieties of crops which experiments conducted at the different agricultural colleges have shown best adapted for semi-arid farming.

It has been estimated, says the bulletin, by careful agriculturists that the film surface of a cubic foot of clay loam spread out would cover three-fourths of an acre. When these capillary tubes of the soil extend to the surface the hot sun of our semi-arid lands pumps the water from them, which is seemingly wasted in the dry air of these regions. The earth mulch is the dry blanket which breaks capillary connection between the under surface soil tubes and the hot outer surface, checking this seriously rapid evaporation. Of course, the finer the mulch the more perfect its action. Were it not for the winds on our plains we could make a dust mulch, and thus get the most perfect earth mulch for checking evaporation of moisture from the soil. The danger from wind blowing soil and seed from the field is too great, and farmers are cautioned not to make the earth mulch too fine. Leave the soil as loose as possible on top, so as to prevent this capillary action reaching to the surface, but do not make it of dustlike fineness.

* * *

Professor Olin, basing his conclusions upon his own researches and experiments, as well as those of others, says among other things:

"Methods of farming which (a) conserve the soil moisture, (b) prepare a good seed bed, (c) reduce the evaporation to as near the minimum as possible, (d) use good vital, acclimated seed, (e) employ a crop rotation which has stock foods prominent, contain at least one money crop, (f) and the practice of thorough tillage of the ground, often tide the farmer over bad years and insure his success in good years.

"Present day experiences and experiments demonstrate that fining the soil has a tendency to render more plant food available.

"All so-called soil culture systems are groupings of few or many of the principles of the thorough tillage system which is the corrolated experience of our best farmers of past and present time.

"The thorough tillage system of farming considers: Time and manner of plowing the ground; time and manner of harrowing; firming the soil and formation of an earth mulch to arrest evaporation in semi-arid regions; summer culture to fine the soil, conserve moisture and prepare a good seed bed for any crop under drouth conditions; principle of capillarity and how moisture may be conserved; selection of seed and rate of seeding; crops which have shown drouth-resistant power; amount of moisture required by plants; average crop season rainfall for a period of years in locality where farming is to be practiced; crop rotations most profitable for the farmer and the land.

* * *

The all important point made in Professor Olin's bulletin is the one that under this dry farming system small grain, forage crops, potatoes and vegetables in general, can be successfully grown with out irrigation. Thorough tillage taking the place of moisture which falls in the humid countries of the middle west.

"Experiments conducted in Colorado in the semi-arid lands have shown, says Professor Olin, "that thorough tillage will undoubtedly increase the areas where these crops can be successfully grown in our semi-arid lands.

"Ten inches of rain furnishes enough moisture to mature more than twice than number of bushels of wheat per acre.

"The amount of rainfall, together with the selection of drouth-resistant crops, must be considered under any system of soil culture—under semi-arid conditions."

The future of California rests to a greater degree on understanding and operating the soil than it does on the volume of water to be derived by irrigation, for if by a system our semi-arid lands can be made to produce good crops by tillage, where no crops are grown today, we shall have added to the fertility of the land by cultivation, and not withdrawn its richness by constant irrigation. It is here the whole proposition of dry farming finds its basic worth.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

The lemon harvest is just beginning at Lemon Grove and promises to be very large.

Will Cox has bought almost all the prunes in Ukiah and Hopland at prices ranging from $60 to $85 a ton.

The olive growers of the Sacramento valley will meet in Sacramento on Saturday, the 18th, to form an olive growers' association.

The fruit driers of the Pajaro valley have handled upwards of 125 carloads of apples this season and most of the the fruit was of splendid quality.

Professor Waite, whose work in connection with the pear blight is so well known in the Sacramento Valley, is now on his way to California from Washington.

The tomato growers of Glendora have formed an association on the plan of the local citrus association and are now shipping heavily. About forty acres of tomatoes will be picked.

The report of a new disease of the orange around Fair Oaks in Sacramento county, seems to have been based merely upon an unusual percentage of decay in some orchards.

The Redbanks orchard near Visalia boasts of a 19-months-old peach tree which is 11 1-4 inches in circumference, each of four main branches measuring 7 inches. It is twelve feet high and has a spread of 10 feet..

Five hundred acres in the Coachella valley will be planted to grapes. Orders to that amount have been placed. The past season proved that table grapes can be put upon the market here, nearly two months earlier than from any other place in the United States.

The citrus fruit crop in Ventura promises to be from 10 to 15 per cent. greater than last year, and the price also promises to be better, especially on oranges. The growers in several parts of the country have made extensive additions to their packing-houses, notably in Santa Paula and at Limonera..

First shipments of oranges have been made from Exeter, Tulare county, and Rocklin, Placer county. These oranges are not ripe; they are merely yellow and have the exterior appearance of ripeness, but since the Placer county oranges are destined for Australia, these at least will be ripe before they reach their destination.

The twelve-acre, fourteen-year-old lemon grove of Henry Bigelow, at San Gabriel has been a winner this season. He has picked lemons twice a month since May, and has sent 2338 packed boxes to the market. For them his gross returns have been $10,677, and his net returns (exclusive of picking) $9986—or practically $10,000 from twelve acres.

Here is the output of oranges from Southern California during the last twenty years: Beginning with the season of 1886-87, the figures representing carloads lots and each enumeration representing the annual shipment, the facts are as follows: 1000, 1800, 2600, 3150, 3600, 3900, 4100, 5100, 7135, 6415, 7350, 13,987, 9448, 16,362, 21,173, 17,571, 19,776, 21,117, 1904-5, 25,671 carloads.

This year the orange crop in the Ojai will reach 75,000 boxes, Santa Paula will grow 125 carloads. The Fillmore section will have 200 cars and Piru and Camulos twentyfive cars. Of the lemons there will be 350 cars from Santa Paula and Limonera, and 60 cars from Fillmore. Last year Limonera, where the b iggest lemon orchard in the world is located shipped 265 cars. Many new orange and lemon orchards have been put out during the past season.

Perhaps the most profitable lemon trees in the whole State this year are eightytwo full bearing Villa Franca trees in the neighborhood of Chula Vista, San Diego county. They have had a phenomenal summer crop, and besides the fruit has brought extraordinary prices. From these trees on less than an acre, have come 332 packed boxes. These went in a car to Boston in September, and they sold for $6.73 a box. Mr. McPherson got as his share of sale $1713, or at the rate of $2000 an acre for his crop.

One of the best reports of lemons is that which comes from the Carpenter twenty-acre grove at Santa Paula, in Ventura county. The grove has yielded 3748 boxes of lemons since May 14th, and the exact and aggregate returns from the sale of these are $11,647. The net returns after deducting for picking, packing and boxing, are $9862. The grove has yielded since November, 1904, 8553 packed boxes of fruit, and the total net returns from the property have been $12,236. Mr. Carpenter paid $21,000 for the grove in 1903.

AGRICULTURE.

Farmers around Berros and Nipoma report general agriculture crops rather lighter than those of average years.

There is considerable agitation in Tulare county over the suggested organization of a county agricultural society.

The first rain of importance fell at Highland, 5th and 6th, amounting to 1.03 inches. Farm lands were put in fine conditions for plowing.

Last week 312 carloads of potatoes were shipped from Stockton, and every day for over a week a trainload has been sent out by the several shippers.

There are on exhibition at the Riverside Chamber of Commerce two mammoth pumpkins. One of them weighs 117 pounds, and the other 90 pounds.

The farmers around Dixon are awakening to the importance of alfalfa in that section and the coming season will see a heavy increase in acreage over that of past years.

Ventura county ranchers get five dollars per ton for baled bean straw, in the field. It is used for cattle feed mixed with beet pulp and in some cases it is fed to horses.

Fuller Brothers again rented a large portion of the Olinda ranch near Fullerton and will seed about 2000 acres to barley and will plant thirty acres to cabbages.

Valley Center's ranchers have garnered large hay and grain crops this season, and in fact all farm products for the season or year of 1905 should be recorded as altogether satisfactory.

The cantaloupe growers of the Exeter—Lindsay district met last week, and after a short discussion concluded to organize an association for mutual benefit and head off the steal of the next year's crop.

H. M. Prouty, of San Jacinto has the first ripe ears from his fall crop of corn, 83 days from planting. The variety is the "Minnesota King," the old eight-rowed variety grown in the northern states. It does very well here as a fall crop.

Pie pumkins continue to go out from the San Fernando Valley by the carload to the cannery in Los Angeles. In all about 300 tons will be shipped and the ranchers say that they can't see that any have been taken, the crop has been so heavy.

The first complete trainload of potatoes ever shipped from California by one firm was sent east this week from Stockton. It consisted of thirty five refrigerator cars containing 270 sacks to the car, or a total of 9450 sacks of 1,334, 000 pounds of tubers.

Farmers in Central Washington are pooling their wheat with the view of holding until they can secure 75 cents for their crop. A large number of heavy producers are enlisted in the movement, and it is expected to tie up nearly 2,000,000 bushels in the pool.

Hops are reported as seling in Oregon all the way from 9 to 11 1-4 cents, the latter figure being reported as paid for an exceptionally fine crop. It is claimed that the mortgaged crops are now nearly out of the way and that hereafter better prices will be got.

Over three inches of rain fell in the Westminster section of Orange county last week, followed by clear, warm weather. Grass and other vegetation has started finely. Celery shipping is brisk, about ten carloads going out daily. Many farmers are plowing and sowing barley.

A "tough" melon story comes from Sonora, Tuolumne county to the effect that a man recently operated upon for appendicitis was found to have a melon vine growing in his in'ards, bearing a well developed melon of five pounds weight. This is indeed intensive agriculture.

The third of the season's rains, amounting to 3.25 inches, fell at Campo in San Diego county last week. It was a fine, warm rain and injured nothing; it will start the fillari grass and brighten the permanent meadow grasses and will also enable farmers to begin plowing in good season.

The grape yield was very light in El Cajon this season owing to a late frost. The crop was mostly shipped green and Los Angeles was the market getting most of it. Farmers are happy over the present outlook from the heavy rainfall—it being the greatest for the month in fourteen years.

The present condition of the Santa Rosa hop market is not specially encouraging, for the growers are not being offered prices that are inducing them to part with the season's crop in large quantities. Some of the dealers predict that prices will be still lower, and are advising holders to sell before the market drops any lower.

The manager of the California Raisin Growers' Company at Fresno, received notice from 137 different insurance companies withdrawing their insurance from the packing-houses and fruit now owned by the association. Raisin insurance is regarded as extra hazardous and is divided among several hundred companies for that reason.

An item has been going the rounds of the press noting as a phenomenal production a yield of 900 beans on a vine in Ventura from one seed. The Connell Bros., in Santa Cruz county, believing that they had vines of greater productive qualities, counted the yield from one seed planted on their ranch and the result was 1859 beans—and this is an apple and strawberry valley, too. Next!

The unusually heavy rain first of the week benefitted San Diego county beyond computation. In the higher portions of the county the rainfall exceeded five inches; at ordinary elevations, where large ranches are located, the rainfall averaged between three and four inches. There was very little run off. The soil is in splandid condition for plowing annd farmers are putting in every available acre to grain. Citrus and olive orchards are in better condition than for years.

LIVE STOCK.

Weaver & Edie recently brought into Imperial valley from New Mexico, over 6000 head of sheep.

Escondido reports that the prices of fat hogs and cattle in that section are very high, and the ranchers are highly pleased with their returns from the sales thereof.

San Juan reports busy times out at the Chili pepper farm. All the way from 50 to 75 people are daily employed in picking and 2600 to 2800 boxes are daily being handled.

The report comes from Mendocino county that the stock men are much exercised over the delay in the fall rains, and fear they will have a hard time getting their stock through the winter.

Live stock and poultry have had a good season around Nipoma and Berros in Santa Barbara county, this year, while general crops have been light, so that added interest is being shown in the first named industries.

A BIG DOLLAR'S WORTH.

The December number of the Delineator is nothing short of a "whopper" with its total of 250 pages filled with matter of value and interest to every member of the household. In addition to its extra large size it contains several beautiful colored plates on subjects of general interest, and best of all is the promise of the editor that every number for 1906 will be fully up to the standard and size of this mammoth number. When we note it is still at the same low price, one dollar a year, we cannot but feel that it should be in every home.

LINERS

FRUIT GROWERS, ATTENTION.—USE Griffith's Smudge Fuel. Don't let your fruit freeze when you can be protected by using Griffith's Smudge Fuel. Stoves, 50c each; 20 stoves per acre, stoves good for ten years. Fuel $8 per ton; 16 lbs. to the stove lasts four hours. Address, 1023 So. Broadway, Los Angeles.

C. H. SESSIONS, ASSOCIATE EDITOR

DISEASES OF CATTLE AND HOGS.

By Charles Keane, D. D. S., State Veterinarian.

The following paper was read at the Farmers' Institute, Dinuba, Nov. 2d.

Live stock, as you are aware, suffer from a number of contagious diseases, some of which are directly comunicable to the human being, and these are interesting to the stock raiser and farmer not only from this important fact but also from an economical point of view. We have also a number of communicable diseases affecting live stock and which are interesting to the stock raiser only from an economical standpoiut.

This paper must necessarily be brief and practical, and for this reason we will only mention the diseases that are more commonly met with in this locality, and we shall endeavor to do this in as concise and practical a manner as possible.

Of the class of contagious diseases not directly communicable to man, and from which from time to time you have suffered losses, I might here mention the following: black leg, hog cholera, contagious abortion in cows and southern cattle fever.

Black leg is a more or less common affection among young cattle throughout the Western country. It is a wound infection disease, that is to say, an infective disease due to the absorption of the bacilli of black leg into the body through injuries in the skin or mucus membrane. The disease is characterized by a rapidly increasing swelling at the seat of inoculation. This swelling crackles on being handled, due to the presence of gas therein. These swellings may appear on different parts of the body, and are usually found on the upper parts of the thighs, neck, shoulders, lower regions of the chest, loins, and brisket. Occasionally the region at the base of the tongue is the seat of the swelling. The swelling is at first small and very painful but rapidly increases in size and becomes painless. The disease runs a very rapid course, and as a rule, ends fatally in from one to three days. Black leg seldom attacks cattle over one year old, although cattle up to five years old have been known to become affected.

Black leg is such a malignant disease, and its course is so rapid that curative treatment is out of the question. We have, however, an excellent preventative. This consists in the introdutcion beneath the skin of susceptable animals of a vaccine consisting of an attenuated form of the bacilli which are the cause of the disease. This is introduced either in solution by means of a hypodermic syringe or in solid form, either by means of a cord, or by means of a special instrument in the form of pill. When the vaccination is performed properly and cleanly, and if the vaccine used be good, perfect immunity is conferred to practically every animal vaccinated. My advice to farmers and stockmen who have annual visitations of black leg is to vaccinate their young stock every spring and fall. You know about the time the disease usually breaks out and it then becomes your duty to vaccinate some little time before this occurs.

Texas or Southern cattle fever which in former years occasioned great losses in this county is practically stamped out here. I belive we have only one infected ranch in the county, and we will devote our efforts to clean that up. You are in no danger of receiving the infection from the Southern counties in this state as we are maintaining a very rigid quarantine.

Contagious abortion among cows has appeared at different times along this valley. This disease is decidedly of an infectious nature although the specific organism has not yet been isolated. The disease is very difficult to suppress when once it gains access into a herd of milk cows, and as a consequence is the means of much loss to the dairyman. It must be combatted with the most rigid sanitary measures. Cows in calf not affected should be separated from cows which have aborted, and they should be handled by separate milkers, etc. All slunk calves, their envelopes, and discharges should be cremated. The posterior parts of the affected cow should be thoroughly disinfected with a two per cent. solution of lysol, or 1 to 2000 solution of corrosive sublimate. All the manure and sweepings in the barn should be removed and burnt, and all woodwork disinfected with one of the disinfectants mentioned. The vagina and womb of the affected cow should be irrigated once a day for two weeks with the two per cent. solution of lysol. This is done by means of a hose and the solution is poured into the hose from an elevation and allowed to gravitate into the uterus. The bull should receive proper attention, and not be allowed to serve both affected and non-affected cows. A very good plan is to disinfect his genitals daily as long as the disease persists. I belive the bull the greatest factor in spreading the affection among cows.

For hog cholera we cannot give you very much encouragement. The U. S. Department of Agriculture has been endeavoring for some years past to manufacture a serum for use as a preventative against this disease but the Department has not yet been successful. The trouble seems to be due to the fact that hogs very often suffer from several entirely different affections at the same time. Of course all sanitary precautions should be adopted such as, removal of the healthy from the sick, cleaning up and disinfection of premises, and cremation of dead animals. Separate attendants should attend the sick and healthy animals. A practice which is coming much in vogue, and from which good results have followed in hog cholera outbreaks is to run the hogs through a dip into which is placed a disinfecting solution, such as a 2 1-2 per cent. solution of creolin.

Coming to the diseases that are directly communicable to the human family, and at the same time have an economic importance to the stock-raiser and farmer, we might here mention three, viz: anthrax, tuberculosis, and glanders-farcy.

Anthrax is a disease of great historical interest. It is perhaps the oldest-known infective disease of animals. It is considered to have been one of the plagues of Egypt, and from which great numbers of men, cattle and mules died. A number of human deaths have been reported in this state from direct inoculation from affected animals. This inoculation of man usually takes place through the pernicious practice of skinning animals which have died from this affection. The disease usually manifests itself during the fall of the year on low, marshy, undrained lands. Preventative inoculation, when the vaccine is properly manufactured, and properly administered, has been of some assistance in checking anthrax outbreaks. The most rigid sanitary precautions should be adopted when this disease manifests itself.

You are all pretty well educated on the subject of tuberculosis, but the insiduousness of this disease cannot be impressed on your minds too strongly. That this disease is communicable to man through the flesh and especially the milk of affected animals there is now no question. We have a means of cleansing our herds from tuberculosis by means of ascertaining the affected animals through the tuberculin test. But after ridding the herd of the tuberculosis cows it is absolutely necessary to see to the proper sanitary conditions of the healthy animals. Plenty of light and ventilation in the cow barns is an essential feature in preventing re-infection of the herd. Good drainage is also essential. The barn floors should be impervious to seepages, and the feeding troughs should be constructed of concrete or lined with metal so they can be thoroughly flushed out after each feeding. In bringing new stock into the herd they should first be tested in order to eliminate any which may be tuberculous.

While speaking about tuberculosis I would like to call your attention to the alarming extent of tuberculosis in hogs which prevails at the present time. Since the introduction of the centrifugal process in the separation of cream from milk tuberculosis in hogs which have been fed on skim milk has increased alarmingly. This is due to the fact that during centrifugalization the majority of bacteria, the tubercle bacilli among them, are conglomerated in the sediment left from this process, and this is very often fed to pigs. Of course this can be very easily eradicated by cooking before fed to pigs. I do not believe that cooking will greatly, if at all, affect the nutritive value of the skim milk.

The subject of glanders-farcy is one that you all should take great interest in. It is a disease fatal both to man and solipeds, as well as to a number of other domestic animals. Its prevalence in this, as well as other states, is due to carelessness and criminal negligence. Right here let me mention that glanders and farcy are one and the same disease, differing only in external manifestations. In a broad sense farcy is that form of the disease where the skin is affected, while in former times when the nostrils and internal organs, especially the lungs were affected, the disease was termed glanders. At the present time no matter in what portion of the anatomy the disease is located the affection is called glanders-farcy, a compound word. This disease is characterized by a discharge from the nostrils usually from only one; the formation of ulcers or chancres on the mucus membrane of the nostrils, and tumefaction or thickening of the kernals or lymphatics in the space between the lower jaw bones. Glanders of the skin manifests itself in the formation of nodules or boils, the favorite seat of which are the limbs, shoulders, and along the sides of the body. These nodules vary in size from a pea to a walnut. The lymph vessels in the neighborhood of these nodules fre-

TUBULARS WRING GOLD FROM MILK
Tubular butter brings 25 to 35 cents. Cream is worth only one cent for stock food. Yet many farmers have no separator—only half skim their milk by setting—lose 24 cents on cream fed to stock—and wonder why dairying don't pay. Tubulars stop this loss.
Tubulars get the last drop of cream out of the milk—make big profits. Tubulars are the only modern separators. Notice the low can and enclosed gears. Write for catalog S-260

quently become irritated and stand out like whip-cords. Any horse, mule or ass with a chronic discharge from the nostrils is a suspicious animal, and should be examined by a competent veterinarian. Frequently we have what we term occult glanders, and as the name indicates no external symptoms of the disease are manifested. The disease is usually located in the respiratory tract. These occult cases of glanders are the greatest factors in spreading the affection on account of the fact that the disease is not suspected to exist in the stable, and consequently no precautions are taken. We have a test, called the mallein test, which is used to detect cases of occult glanders. This test is similar to the tuberculin test. It is necessary then, in order to stamp out this malignant disease, when glanders is found to exist in a stable, to test the remaining animals in order to detect the presence of any occult cases. Without taking this precaution it is almost impossible to eradicate the infection.

We should bear in mind the fact that in glanders-farcy, as well as in all other contagious diseases of animals, the most rigid sanitary precaution should be observed. All animals which show physical signs of the disease, as well as the animals which react to the mallein test should be taken out and destroyed, and their carcasses cremated. The stable should be thoroughly cleaned and disinfected. Halters, harness, in fact everything that has been in contact with affected animals should be thoroughly washed with a disinfecting solution. All woodwork in the stable should also be thoroughly disinfected and later whitewashed. Attendants in charge of suspicious cases should be cautious to adopt sanitary measures in order to protect themselves and to prevent the spreading of infection.

THE COLT THAT SCARES.

"We have all had experience with frightening colts, I have," says J. A. Dobie in Successful Farming, and I want to say a few things about them."

"Nearly every colt when first driven away from home will scare and shy more or less. If he does not, he is a dull, stupid thing. He does not scare from meanness, but because he sees something he thinks is going to hurt him. I know how provoking it is to have fed a horse hay three times a day and when taken out on the road to see him scare at a little bunch of hay by the roadside. The first thing that comes in our minds is to give him a cut with the whip and jerk him back into the road. Nothing worse than this could be done. The next time he will not only be afraid of the object but of the whip, also. By a little training in this way he will soon be confirmed in the habit of scaring and shying off at every unusual object he sees. Many good horses are ruined by this senseless practice.

Let him take a look at this frightful thing, and as soon as he learns that it will not hurt him he will pay no attention to it. The man who cannot take time to do this is too busy to train a colt. It is not best to lead him past an objects than frightens him, if it can possibly be avoided. He will soon want to be led past everything he does not like the looks of. He can be driven past almost anything if he is given a little time to look at it.

The horse that whirls square around in the road when frightened at something ahead of him is not only disagreeable but dangerous. It can be prevented when he is driven double, but not always when he is alone. The remedy is to work him with a trusty animal at first, and then alone to some two wheeled rig, handling him carefully, but firmly. Only recently I was badly hurt by being thrown into a barbed wire fence by such a horse, although he didn't get away from me.

What shall we do with the horse that takes fright and runs as if possessed by a demon, paying no attention to any bit, however severe? It is hard to answer. Some of these cases are hopeless. I would like to submit a few don'ts: Don't take an aged person, a helpless child, a timid man or screaming woman in a rig behind such a horse. Don't attempt to work him without a severe bit, strong harness, strong lines, strong hold-back straps and a stout rig. Don't take any chances, believing that you can handle any horse, for you can't. The man who has had real experience never makes such claims. The one who does is the boy in his teens, or the man who never ran up against a really bad case.

Almost always, a man can control and cool down a horse, provided he can control himself and keep cool. Some men get rattled as soon as a horse pricks up his ears and quickens his gait, and their bawling, frightened voice will scare him, about as badly as anything else. On the other hand, if we can get his confidence, if we can make him believe that nothing can hurt him so long as we have him by bit or lines, it is really wonderful what may be done in the way of controlling him by the voice alone.

After all, everything depends on the man. If he has not patience, if he is not cool headed, if he has not sufficient interest to study the horse and the best way to manage him, he will meet with poor success. Excitable, quick tempered men are usually cowardly Such as these should never attempt to handle the unruly horse.

TO FEED IRISH POTATOES.

Is it better to cook Irish potatoes or feed them raw to pigs? Please answer in Cultivator.—A. P., Anaheim.

If you can boil potatoes and mix with bran, salt a little, you will get better results for fattening than to feed raw.

BEEF TYPE v. DAIRY TYPE FOR BEEF PRODUCTION.

The Iowa Station has recently reported the results of a year's feeding test to determine the relative economy for beef production of the beef and dairy types of cattle, a question which is receiving much attention at the present time. The results attained are summarized as follows:

Dairy type steers show a considerably higher percentage of offal and a lower dressing percentage.

Dairy type steers carry a higher percentage of fat on internal organs, thereby increasing the total weight of cheap parts.

Beef type steers carry higher percentage of valuable cuts.

Beef type steers furnish heavier, thicker cuts; they are more evenly and neatly covered with outside fat, show superior marbling in flesh, are of a clearer white color in fat, and a brighter red in the lean meat; but there is little difference in fineness of grain.

The low price paid for dairy steers may be due partially to prejudice, and to the greater expense of carrying and selling the lower-grade carcasses; but it is chiefly due to an actual inferiority in the carcasses.

It is neither profitable nor desirable to feed steers of dairy type for beef purposes.

They are unsatisfactory to the consumer because they do not furnish thick and well marbled cuts; they are unsatisfactory to the butcher because they furnish low-grade carcasses which are difficult to dispose of, and they are decidedly unsatisfactory to the feeder, because they yield him little or no profit, and both breeder and feeder waste their time in producing such a type of steer for beef purposes.

MILK ORDINANCE DEFEATED.

A decided victory was won by Berkeley milkmen recently, says the Encinal of Alameda, over the restrictions placed upon them by a town ordinance, which they succeeded in having declared unconstitutional. The law required them to get a permit from a food inspector, and before this would be issued they were forced to sign their consent to the provisions of the ordinance, which virtually made them sign away the right to redress in case their animals were killed illegally, and upon this point the ordinance was declared invalid by Judge Melvin."

The milkmen objected to the new milk ordinance recently adopted in Berkeley on the ground that it required the examination of every cow with the tuberculosis test, the milk from which was sold within the limits of the town. The milkmen there consider that they have won a decided victory.

The ne wmilk ordinance recently passed by the Oakland City Council does not require the tuberculosis test, but does require that each cow be given a thorough physical examination. To this the milkmen in general do not object.

Dr. A. R. Archibald, milk inspector for Oakland, in an interview concerning the decision in the Berkeley case, expressed the opinion that the requiring of the tuberculosis test should be made under a Federal or State law, and that single communities should not attempt to introduce it in their milk ordinances.

The American Breeders' Association will hold its second annual meeting at Lincoln, Nebraska. Arrangements have been made for a three days' session.

The American Breeders' Association will be the guest of Nebraska's numerous agricultural societies which will meet together at Lincoln during "Agricultural Week." Several of the sessions will be held jointly with one or more of the state societies interested in animal and plant breeding.

MINNEAPOLIS, MINN.

SPINELESS CACTI.

By Geo. P. Hall.

Much has been said and written of late, regarding the possibility of solving the problem of making spineless the opuntia section of the cactus family, which is indigenous to the arid regions, especially portions of California, New Mexico, Arizona and even further north. The only difficulty in making it an availabe product for sustaining herds of cattle is the presence of innumerable spines.

In the dryest portions of the desert it may be found in places where it seems little less than a miracle that it could survive. We shall not in this brief article attempt a description of the many members of this wonderful family, but speak of the one most known to residents of the Western part of the United States and Mexico.

There are several well-known forms of the opuntia section growing in Southern California, being everywhere present and known to all. The flat, broad leaved opuntias covered with bristling spines that make them dangerous to handle unless well guarded, is however the variety that is sought for as food for stock and even in its spiny condition stockmen use it, after by various means removing as many of the spines as possible. But the plant-breeders have been attempting to produce a spineless sort, one that stock can feed upon without danger of their mouths being lacerated by the cruel thorns.

For many years it has been known that a variety of opuntia that was nearly without spines was growing generally in the neighborhood of some of the old missions, where it had been planted in the early history of the state. From these parent hedges have been taken from time to time leaves (or lobes) and planted in many parts of the state. The majority of them are not entirely spineless because they were planted as curiosities and permitted to grow their own sweet way without any idea of making them better than were the original forms, hence are little better as a food product than the wild kinds bristling with a fierce array of thorns.

It has been our privilege, however, to be put in communication with a gentleman who has a limited quantity of the genuine spineless opuntia, the lobes are large, thick, succulent, and reproduce themselves very fast, especially where water and cultivation is accorded. The discovery of this lot of cactus, from which a supply is now available, was made by Mr. J. C. Hill, a civil engineer, while surveying the line for the irrigation ditch for the Escondido water supply. He brought home a specimen, being particularly fond of the varying forms of cactus, and it has of late years been in the keeping of his venerable father, who has supplied the family cow, fowls and ducks from the hedge, planted some years since. Where it is watered it produces immense succulent lobes a foot or more in length and nearly an inch in thickness.

In the vicinity of San Antonio, Texas, the spiny cacti are in great demand and are prepared by burning the spines from the lobes. Mr. J. W. Stacher feeds 100 dairy cows regularly for three or four months in the winter. This is the ration he gives: cottonseed meal, 2 pounds; cottonseed hulls, 8 pounds; bran of wheat or rice, 10 pounds and 30 or 40 pounds of singed "prickly pear" cactus. Mr. Hagerson, a neighbor, having no "pears" buys the cactus for 25 cents for loads of a ton each. He feeds his cattle a ration of bran, 9 pounds, hulls 10 pounds; singed "prickly pear," 30 to 40 pounds.

We give these instances, taken from the Government report, to show that the larger portion of the food is cactus. But the whole history of cactus feeding is blemished by the injury occasionally done to stock by feeding the spiny cactus only chopped up, without the spines being burned off, and even with burning the difficulty is not entirely removed.

This article of food, if rightly handled, will, no doubt, eventually add thousands of dollars to the advantage of the stock grower, dairy man and rancher in arid sections. It is a green feed he can procure when every other kind is dry, is the most succulent leaf in existence, increases the flow of milk, and is an excellent basis for a complete food ration for poultry, swine or sheep. All stock will eat it with avidity. It is one of the newer useful plants that will doubtless solve many problems for the future rancher and stockman.

SYMPTOMS OF HOG CHOLERA.

Editor Cultivator: Will the Cultivator please give me the symptoms of hog cholera? I have lost twelve shoats within two weeks, and don't know the cause. Veterinarians here say my pigs have cholera.—W. B. D., San Luis Obispo.

It is quite difficult to give all the symptoms of hog cholera in one paragraph reply. They differ. Some seasons certain symptoms appear and the next time a wave of the disease comes along a new set of symptoms will manifest themselves. But the result is usually the same—death.

The usual symptoms are: Fever and chills, loss of appetite, loss of flesh, extreme weakness, diarrhoea at the end of the second or third day, bleeding from the nose, closed eyelids, aimless beating about, stumbling, thickening of the ears, red blotches on the belly and ears and lastly bloating—then death.

When any two of these several symptoms manifest themselves, cut out the affected animal from the herd, put in a clean, warm, dry pen and apply the remedies heretofore given in these columns by the editor, who is an experienced hog breeder and raiser, or by Dr. Oliver of the veterinary department of this paper.

LUMP JAW.

Editor Cultivator: Will you please tell me through the Cultivator if there is any cure for lump jaw on cattle when it first starts and oblige.—A. L. N., Santa Maria.

In this number appears a receipe for lump jaw in its initial state.

The party who gives it, Mr. Ball, says he has used it with success. We never have tried it.

LUMPY JAW.

Mr. Eldridge Ball of Arroyo Grande says he has found the following recipe to prove a sure cure for lumpy jaw: Mix well equal parts of pure hogs lard and arsenic, and apply to the affected parts with small flat stick—he says he has also found this a good remedy for warts on horses legs—burn what is left after using.

INOCULATION MAKES BETTER HAY.

The Michigan Experiment Station has been investigating the inoculated nodule method, in regard to its effect upon the composition of the crop. Many farmers have reported that the presence of the nodules has not increased the bulk of the crop; but the station reports, after analysis that the nodules increase the amount of protein present. Two areas of soy beans flourished side by side, one with nodules, the other without; no difference in color, height or earliness was noted, nor greater weight of hay. When analysis was made of the hay, however, it was found that the hay from nodule-bearing plants contained 18.52 per cent of protein, while the hay from non-inoculated plants contained but 9.56 per cent. With cow peas the experience was similar.

The up-to-date dairyman feeds a balanced ration. We suggest that he add patience and supplement the same with kindness, which will surely bring good returns.

VETERINARY DEPARTMENT

BY DR. W. J. OLIVER,
318 East Second St., Los Angeles.

To the end that this department may be made as valuable to the subscribers as possible, we ask observance of the following: Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease ap eared. Give your name and address, which will not appear in the paper if you so request. No charge whatever is made for such questions as are answered through the colums of the Cultivator, but when an immediate mail answer is wished Dr. Oliver asks an additional fee of $1.00 and will give immediate attention and reply by mail. In such case write Dr. W J. Oliver, 318 E. Second St., Los Angeles, Cal.

Questions should be in by Monday to be answered in the following Friday's paper.

SLOBBERS.

Editor Cultivator: I have a mare that is drooling some, hair looks rough and does not look well in the eyes. What would you suggest for her? She is not old and I had her teeth fixed.

Please let me know through Cultivator.—F. S. D., Vacaville.

If you have had the mare's teeth properly treated, examine the mouth particularly under the tongue for barley beards or fox tail, that or sharp teeth cause the drooling. The cause indigestion; give the following: sulp. of iron 8 ounces, powdered gentin 6 ounces, willow charcoal 4 ounces.

Give good tablespoonful twice a day in bran, mash or rolled barley.

* * *

INDIGESTION.

Editor Cultivator: Please tell me the cause of the condition of my horse. His bowels are not right. He passes too much water with his stools. He has good feed and little work. He is in poor flesh.—P. C. B., Corona.

Your horse has indigestion from improper mastication. Mix 1-3 bran with his barley and feed dry. Give along with feed a cupfull of oil cake meal at each feed. Don't water for one hou. after feeding.

* * *

UNCERTAIN IMPREGNATION.

Editor Cultivator: Will you please tell me what is best to do with a young heifer (her first calf now about nine months). Cannot get her with calf. have driven her three times and changed the male once. Please answer through this week's Cultivator.—R. P., Riverside.

It will be necessary to have the os uteri dilated. This will require the services of a person who understands the anatomy of the parts and proper appliances.

OPERATING AN INCUBATOR.

In our last talk on Biddy and the incubator we decided that in order to compete with Biddy, the incubator must be properly located in a well ventilated room, must be perfectly level, tested by a carpenter's spirit level, the thermometer also must be absolutely correct and tested, and if the old thermometer has been broken the new thermometer must be tested and hung in the same position as the former one, the bulb being exactly in the same level as the one which belonged to the machine; a little difference in the height or in the position of the bulb may make a great difference in the heat on the egg tray. You cannot be too careful and particular about these small items, perfecting these means success; carelessness or trusting to "luck," means failure.

We saw also in our talk on "Biddy and the incubator" how necessary it is to feed the fowls properly to secure fertile eggs, but all fertile eggs will not hatch, there must be certain conditions of the egg and amongst the most necessary is a good egg shell, neither too thick nor too thin, but just right.

"Don't put eggs into the machine that you think may not hatch, and above all never sell eggs for hatching which you think are doubtful. I said to a friend "But how can you tell" asked my friend "before you put them into the incubator, which eggs will not hatch?" "You cannot tell all of them," was my reply, "but after supper we will look at the eggs you have ready and I will show you those that will not hatch. After supper we put the trays of beautiful fresh eggs on the diningroom table, put the egg tester on the lamp and then looked at each egg as if testing it. Any egg that was chalky to the touch, or had light spots on it or was freckled all over with clearer places or having one or more light thin places, or thin at the little end, or cracked, or crooked was rejected. A few of the doubtful I marked with "d" and left them in, (these, I afterwards heard, did not hatch,) I think I tested out fifteen out of three hundred, these were replaced by other good eggs. It is much easier to detect the imperfect or unhatchable eggs by looking at them through an egg tester than by merely feeling them, of couse it is a little more trouble but it is a saving in labor and a lessening in expense of oil, besides giving more room for hatchable eggs and a better chance for a good hatch, as the infertile eggs chill their fertile neighbors and draw from their vitality. Therefore select carefully your eggs before putting putting them into the incubator.

* * *

Poultry keeping is made up of little things and is so easily ruined by little things that I will add a word of warning about testing, do not hold the egg in testing it so close to the lamp that it will heat it. The tiny germ of life in the egg is very tender and may easily be killed by the heat of the lamp, or any sudden jar (handle the egg as carefully as oranges.) To avoid heating a small spot on the egg and to facilitate testing large numbers of eggs I made a home-made tester out of a cardboard cracker box. I cut a hole the size of half a dollar, just opposite the place where the flame of the lamp came, when I set it inside the box, in this way I did not overheat the egg when testing and could handle eggs very quickly. I found this box egg tester very handy for testing eggs under setting hens out of doors, using a lantern instead of a lamp. Eggs whether under hens or in incubators should always be tested. There are thousands of eggs lost and wasted every year from carelessness in this matter. An egg which is infertile, in which there is no germ of life, and that has been under a hen or in an incubator for a week is perfectly good for food. It is simply an egg that has been in a warm place for a week and is as good or better than the average store egg. Infertile eggs keep fresh much longer than eggs that have been fertilized, there is no germ of life in them, so there is nothing that will die, there is no dead germ in them.

Persons who are raising only eggs for market should keep no males and never have fertile eggs.

* * *

Do not put eggs from different classes of fowls into the same incubator. Hens' eggs take twenty-one days to incubate but if eggs from Leghorns are placed in the same tray with Brahmas or Rocks, the Leghorns will be the first hatched, sometimes as much as two days sooner, to the detriment of the larger breed, which are slower in hatching. The danger lies not only in the earlier hatched chicks walking over the eggs but from the change in the atmosphere and temperature at the time of hatching. The air in the incubator is then always heavily charged with moisture and the temperature always rises during a hatch from the activity of the chicks, and it is exceedingly difficult to regulate the temperature when the incubator is full of chicks in all stages of hatching. The rise of temperature does not hurt the chicks that are just breaking out of the shell, but if it takes place two days too soon, it will ruin the hatch of the heavier and slower breed, many chicks will be smothered in the shell. Experiments that I have made along these lines have always given the same results.

It seems needless to say that the eggs should be clean. Any dirty eggs should be washed in tepid water, before putting them into the incubator. All ducks eggs should be washed as they are usually covered with dirt. Dirt or grease or a broken egg will so coat the eggs as to prevent evaporation and the circulation of air and will smother the life out of the germ or embryo.

Choice Alfalfa or Chicken Ranch
Twenty acres good sandy loam soil, no alkali, abundance of water, 5-room house, large barn and incubator cellar. Near Anaheim.
WM. A. GREEN, BOX 401, ANAHEIM, CAL.

Walnut Grove Poultry Ranch
Standard Bred White Wyandottes, (Hay's strain). Eggs for hatching from carefully mated stock, $2 per 13; $12 per 100.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER

Used by all the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders
The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the GOLD MEDAL at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.

And Now Comes New Reward for Merit:

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

EDITOR'S QUESTION BOX.

Ducks, Etc.—(Mrs. S. D. K., Orland). After seven months of trying the eastern climate, I am back in California "for keeps," and the few weeks I've been here have so built me up that I am back into the poultry business with more inthusiasm than ever. In fact I knew how it would be and brought with me seven beautiful Mammoth Bronze turkeys hatched from eggs from Mrs. Schoffner's flock, at Mulberry, Tenn.

The Tom she exhibited at St. Louis weighed 55 pounds.

Now, we have 14 Pekin ducks and I know next to nothing about their care. Will you please tell me where I can get the needed information? I would love to ask for a personal letter, but will not because I know how very busy you must be now after your trip, which I trust you enjoyed to the fullest extent. So please just insert a line in the "Cultivator." O, I must tell you I had the "Cultivator" sent east when I left last spring, and my mother likes it so much that I have never changed it. Will subscribe anew for myself. Then Mr. K——'s mother was so delighted with it that she asked me to send in her subscription with my own. So the Cultivator will visit two homes in Southern Indiana next year.

Answer. The Cultivator is glad to welcome you back to sunny California and appreciates your kind words. In the editor's question box on November 10th, is a reply to your question about Pekin ducks.

You would find one of the Reliable Poultry books called "Ducks and Geese" (price 50 cents) of great help to you. It can be had at any poultry supply store or by sending 50 cents in stamps to the Reliable Poultry Co., Quincy, Ill., it will be sent to you.

* * *

Packing Eggs.—(E. J. D., Corona). I want to know the very best way to pack eggs for shipment. Your poultry suggestions are always to the point.

Answer. There are a number of patent egg boxes on the market all more or less satisfactory, but the "very best way" to pack eggs is in slat baskets, which I always bought by the wholesale, either at the Los Angeles Woodenware Co., or at a wholesale grocery by the dozen as they were for sale again with the eggs. The small size held one sitting, medium two, and largest size three or more. First of all choose the eggs as I have described in today's talk on incubators then stamp or write your name on the egg, wrap each egg in a square paper. I find newspaper is the best kind as there is more spring and resistance to it than to tissue paper, cut one page of the Times, or similar sized newspaper, into six pieces, this is about the best size, wrap each egg in one piece of paper, I always lay the egg on its side roll it up and twist the paper, (screw it up) at the little end of the egg, so that when all the eggs are wrapped I know which is the little end of each. Put a layer of excelsior (which I buy at a furniture store) in the bottom of the basket, wrap each egg in a little excelsior and place them always with the little end down in the basket, cover with a layer of excelsior, put on this your circular or a paper saying "keep these eggs in a cool, quiet place for twenty-four hours before incubating to insure a good hatch." Then sew a piece of burlap or muslin on top, taking care to fasten it down tightly so the eggs will be kept firmly in their place. A large packing needle and string should be used for the sewing. I have gone into particulars very fully because in all my long experience I only had one complaint of broken eggs.

* * *

Dry Feed.—(Mrs. F. A. F.) I have been much interested in the question of dry feeding from hoppers. The only question with me is this, how can I make the hens take exercise if I feed in hopper? They are shut up in runs and I feed grain in the morning in litter to make them exercise. They are White Wyandottes, and I fear would grow too fat if they took no exercise. Will you kindly tell me what you think of this in the Cultivator.

Answer. Dr. Nottage, who was, I think, the first to advocate the hopper method of feeding uses it only on free range. When the hens are brought into yards for the winter he put the same amount of feed (dry grain) into the scratching pen litter, I tell you this because he is one of the chief authorities and I think the inventor of this method. I feed my White Rocks and Black Langshans (I have only a dozen of each for my own use) in the following way. I keep a hopper full of two parts bran, one part calfalfa meal and one part oatmeal or corn meal, and one hopper of beef scraps, also grit, shell and charcoal always before them, and besides this every morning throw a small handful for each hen of grain, wheat, barley, or kaffir corn into the scratching pen. My fowls love to scratch and it keeps them busy and out of mischief. They do not over eat because the hopper has dry ground feed in it and they can only eat a little at a time. They are never ravenously hungry so never fill themselves up and never get lazy. If the hopper contained whole grains possibly it might be different.

* * *

Clipping a Hen's Wings.—(Mrs. M. of Arroyo Grande) Will clipping a hen's wings cause it to stop laying?

Answer. I had a dozen Leghorns that persisted in flying over a six-foot fence, until my patience exhausted, I cut one wing of each, the next day they tried to fly as usual but fell back into their yard, this seemed to worry them greatly and for a few days until they became accustomed to the new condition of life, they dropped off in their laying, they missed the free run and the extra green food and all the fun of tearing up the garden, but in a short time accepted the inevitable and resumed their laying and I think really did better than before. It is no injury to a fowl to clip one wing as far as laying is concerned.

* * *

Green Bone For Ducks.—J. G. H., Santa Ana. Having a nice bunch of Black Leghorns, I want to still increase in number so have ordered Mann's clover cutter and No. 9 bone mill and as I have a flock of Indian Runner ducks of Mrs. Basley's strain, I would like to know if I cannot feed the ducks with "cut green bone" same as I do the hens, and by so doing get more eggs of better fertility and cheaper eggs so as to give me a little profit?

Answer. Green ground bone, sweet and fresh, is excellent food for ducks as well as hens, and will greatly increase the egg yield. Ducks require more animal food than hens, much more, and if Indian Runners have a very liberal supply of it and green alfalfa they will lay an astonishing amount of eggs. I find that the dried beef scraps and the dried beef, blood and bone, are the grandest food for making ducks lay. I do not now use green ground bone because it is too hard work to grind it myself and if I

Food Influencing Color.—(J. L. H., Pasadena). Kindly give the "Cultivator" readers your experience in the matter of feed and care influencing color.

Let me briefly cite a couple of cases that will make my meaning clearer. Last year my neighbor and I each hatched a brood from the same mating of Brown Leghorns. His chicks were poorly fed and lousy and were literally full of white feathers, while mine were very uniform and showed no white in their plumage. Today I saw a brood of late hatched Rhode Island Reds that were extremely bad in color and in very poor condition. I have a brood, same mating and age, that are a third larger and much better in color than the other brood.

Answer. Food and care have the greatest influence on the color of fowls as well as on the egg production. Your comparison of your neighbor's Brown Leghorns and the mating of Rhode Island Reds would be proof enough of this. Canary breeders know this and practice giving canaries red pepper and————————besides iron to deepen the yellow. A friend of mine imported some exceedingly fine canaries from Europe and was surprised at receiving a large package of food with instructions to be sure to feed this at moulting time.

I personally have found that iron will impart a yellow tinge to white fowls if given at the moulting season, it will also intensify the yellow of the shanks and for colored fowls will deepen and brighten the coloring. White feathers in colored birds sometimes denotes a lack of protein in the food, and if those birds are given better care and properly balanced ration they may at the second moult come out all right. Intelligent care and properly balanced food will give always good results and prize winners such as you have whilst your neighbor with the same fowls will not win.

FALL CARE FOR LAYING HENS.

When poultry owners in California are complaining about the scarcity of eggs—that their hens will not lay—as they are doing in the Cultivator every week, the following suggestions from C. S. Green, in the Ranch may be read with interest.

To produce eggs in paying quantities during the winter months it is first necessary that the stock should be in proper condition not later than November 1. Old hens, as a rule, that molt late in the fall cannot be put in condition for laying until the last of January. We rely principally on the pullets hatched the spring previous for our early winter eggs. We may make one exception to this rule. Yearling hens that molt in August will generally be in condition to lay by December and make very profitable winter layers. They must be fed and cared for so as to hasten the molting if they are expected to molt early, as ordinarily a hen will not molt until September.

The process of hastening the molt consists of first reducing the feed so as to stop the production of eggs during the last week of July. When they have stopped laying and have been kept on about one-fourth of a ration for three weeks the feed is then increased gradually for a few days until a complete egg producing ration is fed liberally in quantity. At this time one pound of oil meal to each hundred hens or a small feed of sunflower seed every other day can be profitably fed. Hens and pullets should all be in winter quarters before cold or freezing weather. The temperature of the house should be kept above the freezing point, but should not be forced higher than forty degrees by keeping the house closed at the expense of ventilation.

The entire floor of the house should be covered with six inches of dry, clean straw, which must be changed as often as it becomes damp or soiled. All whole or cracked grain is scattered in this litter. The variety of grain must depend largely upon its availability and cost. A very good mixture would be one hundred pounds of each of whole wheat and cracked corn and fifty pounds of oats. This makes a very good scratching feed for winter. It can be fed to them all they can eat the first thing in the morning. Hens will always work for feed in the morning, as that is when they are most hungry. At 11 o'clock a mash can be given, but it should be very dry, not wet or sloppy. A great variety of mixtures have been used for this mash feed with very good success, and we do not pretend to know which is the best, but 100 pounds of cornmeal, 100 pounds of green cut bone and fifty pounds of peameal make a very good mixture, but hens are fond of it and should not be fed all they will eat.

One hundred pounds of ground oats, 100 pounds of ground barley, fifty pounds of wheat middlings and seventy-five pounds of green cut bone or beef scrap is another mixture that has given good results when fed very dry. A little hot water can be used in cold weather, but too much water will injure the effect of the food. This ground feed should be fed in V-shaped troughs about four and one-half inches deep. After they have eaten two-thirds as much as they will eat a very little of the scratching feed can be scattered on the floor to keep the fowls busy. After this is fed they should be supplied with all the green food they will eat. Mangel-wurtzels are the most palatable of any of the vegetables commonly used. Taking their cost and the ease of keeping them into consideration they will generally prove the most satisfactory of anything for green food in the winter.

Do you keep a mixed poultry yard? Keep the ducks, geese, and turkeys away from the little chicks or they will kill them.

CARE FOR HENS NOW.

The following article on care for hens now does not pertain in all respects to California conditions, and yet, if we remember that our summer—the three hottest, dryest months, when everything is brown unless irrigated, correspond to the winter conditions of the middle-belt, it will be seen that the suggestions herein made are full of good sense. Change the seasons around and work accordingly and your hens will lay.

The greatest success in winter is obtained when the fowls are properly managed in the fall.

When hens are taken off the range, and no longer secure a variety of feed they often cease producing eggs. Before winter begins the poultry man should aim to store a supply of food that will keep his hens in laying condition.

If the condition of summer could be created in winter, the hens would lay well at all times. What are those conditions? Exercise, green food and a variety. The hens not only have grain in summer but also worms, seeds and grass. It is impossible to find worms and green food in the winter, but there is something for the hen besides grain all the time. Grain is the best general food that can be given in the winter, but used exclusively it will not make hens lay.

During the fall, a few cabbages, turnips and refuse potatoes should be placed where they may be had conveniently for winter supply. The use of finely cut clover, scalded with a mess of chopped meat two or three times a week will afford a variety.

When the trees begin to drop their leaves rake up and store for scratching litter for hens in winter, also have a large supply of dirt put away. Take any flock of hens, give them warm quarters, feed other feeds with grain, keep them constantly at work under shelter and they will lay. It is idleness in winter that causes hen to become too fat, and leads them to become addicted to egg eating and feather-pulling.—Successful Farmer.

Never allow your poultry to go to roost hungry.

Scatter the evening feed near the roosting places.

Do not be too sure that your poultry have no lice, examine them and find out.

Will a lazy hen produce an egg that will hatch a vigorous chicken?

It is easier to digest soft food than hard grain and fattening fowls should be given their feed in this condition.

Scalded milk substituted for water will often prevent bowel trouble in young chicks.

A good poultry house saves feed. If you have none plan to build it before winter.

Clean eggs sell better than dirty ones. Soiled eggs are easily cleaned with vinegar diluted with water.

The use of oil on the hens to kill mites serves to accumulate dust and closes up the pores. An insect powder is much better.

The old hen keeps many a family that would otherwise have hard sledding. She is up early digging and scratching around for a living. Her home is usually uncomfortable and uninviting, yet she sings happy as a lark and works like she did not have to lay an egg every day.

Single Comb White Leghorn Cockerels For Sale
A1 Stock, Standard Bred. Address
A. H. BLAKELY - ONTARIO, CAL.

POULTRY FOR SALE
Hammond offers for sale his poultry and all the paraphernalia thereunto belonging.
100 or more beautiful S. C. White Leghorn hens and pullets, with a few cocks. Bred with great care through Howard's high-class prize-winners.

General Agricultural Notes

RAISING DRUG PLANTS IN CALIFORNIA.

By Prof. Albert Schneider.

The United States pays an annual bill of many millions of dollars for vegetable drugs which could be profitably grown at home. Many of our native drugs which were at one time very abundant are becoming more and more scarce, as for example golden seal (Hydrastis Canadensis) and senega (Polygale Senega). Extensive and reckless gathering is causing the Californian to consider the advisability of establishing extensive cascara plantations to meet the ever growing demand for this most valuable remedy. Efforts are now being made to introduce cinchonas (Peruvian Bark) into California. If successful this alone will be a saving of many millions of dollars annually besides giving profitable employment to many thousands.

Numerous plants having medicinal and other economic value have been grown with remarkable success in California, as insect flowers, canaigre, hops, tan oak, calendula, lavendula, inclusive of the so-called pot herbs and garden plants, as celery, asparagus, water cress, lettuce, sage, thyme, mint, to say nothing of oranges, lemons, limes, olives, St. John's bread, almonds, dates, etc., etc. In addition to these there are the plants of more decided medicinal value for which there is a constant demand, which could be grown very successfully and profitably. Only a few of these are here given.

Digitalis (foxglove) (Digitalis purpurea) is easily cultivated and the market is reliable. At present most of the digitalis leaves are imported from England. Several acres should be planted. The leaves of the second year's growth only are used, collected at the time of flowering. It is poisonous, a very valuable heat tonic and vascular diuretic. The seeds also are used. Retail price of good, carefully dried leaves, ranges from 20 to 35 cents per pound.

Monkshood (Aconitum Napellus). This is as readily grown as digitalis and may be similarly cultivated. It is a most valuable fever remedy and diapharetic. The demand is constant. The roots are used and bring from 20 to 25 cents per pound retail. The following drugs could be readily cultivated (with citation of retail price per pound):

Dog grass (Agropyron repens), 10 to 25 cents; Calendula, 35 to 45 cents; Chamomille, 15 to 20 cents; Lavender, 10 to 30 cents; red rose (French), 90 cents to $1; American Saffron, $1.40; Grindelia robusta, 16 to 20 cents; hoarhound, 20 to 25 cents; peppermint, 25 to 30 cents; pots herbs generally with prices ranging from 15 to 30 cents per pound; yerba santa, 20 to 25 cents; damiana, 20 cents; henbane, $1.25 to $1.50; stramonium, 12 to 20 cents; licorice, 10 to 20 cents; burdock, 10 to 20 cents; besides these there are many so-called weeds of medicinal value too numerous to mention. Attempts will be made to cultivate Golden seal ($1.50 to $1.60 per pound); rhubarb does well (40 to 90 cents); valerian could be grown readily (40 cents), etc.

The wholesale price is of course less than the retail. There is no doubt whatever that vegetable drugs can be grown successfully and profitably. All that is required is intelligent effort on a large scale. What is done profitably in other temperate and subtropical countries can be done profitably in California.

Medicinal plants are being tested in the San Francisco Garden of Medicinal Plants with regard to their medicinal value and suitableness for culture in California.

Those desiring more detailed information on the subject of drug culture are advised to obtain copies of the April and May (1905) numbers of the San Francisco Pacific Druggist.

SPRAYING POTATOES FOR THE PREVENTION OF BLIGHT.

A report given on comparative tests on different plats of potatoes sprayed with Bordeaux mixture and Bug Death. Bordeaux mixture and Paris green, soda Bordeaux and Paris green, and the insecticides used separately, comes from a Canadian experiment farm.

Five applications were given the vines, beginning July 2 and continuing at intervals of about ten days. The potatoes were dug October 6, and the yields, increase in crop, and cost of spraying are shown in tabular form. It appears that the Bordeaux-Bug Death mixture gave the greatest increase, the net increase in value amounting to $21.86 per acre. This was followed by ordinary Bordeaux mixture and Paris green, which gave a net increase of $17.68 per acre. The exact cost of application is not given, the expense of applying the fungicides to small plats being relatively much greater than had larger tracts been used.

The cost of applying the Bordeaux-Bug Death mixture was greater than where Bordeaux mixture or Paris green was employed, so that the difference in net gain between the two is less than indicated above. The greater efficiency of the Bordeaux-Bug Death mixture is attributed to its more adhesive quality.

A GREAT PLANT CENTER.

The Chico Daily Record, of Nov. 4, has the following to say regarding the establishment and growth of the well-known Chico Nursery Co:

"In the diversity of his undertakings General Bidwell was a propagator of orchard trees, and as early as 1851 established the Rancho Chico Nurseries, whence came practically all the older orchards of the state; many of them still in bearing, proving the longevity and hardiness of Chico-grown trees.

The conditions which led to the selection of Chico as the one spot in the United States to grow the thousands of diversified plant varieties commended it as a place peculiarly adapted to the needs of a modern nursery and it is not impossible that the showing made here in nursery rows had its effect upon the Government experts in their final decision as to the location of the Gardens; certain it is that the proximity of the two gives the Chico Nursery an enviable position in the eyes of the horticultural world.

With well-chosen distributing points Chico-grown trees, in carload lots, are being delivered, freight paid, over a thousand miles from Mt. Shasta. Results speak volumes in the shape of increased business. Thus does California, and particularly the Sacramento Valley, seize upon the possibilities at her door.

With twenty-five to fifty up-to-date salesmen in the field the year around, this energetic concern has pushed out into the several surrounding states. The long season and rapid growth, together with the thorough ripening and maturity of the wood (with proper men to set forth these advantages) are making Chico-grown trees immensely popular in the north.

PHENOMENAL GROWTH.

E. E. Pellett of Brawley has a willow tree on his place that measures fourteen inches in diameter and forty-five inches in circumference four inches above the ground, and is of a good height. As there was no water on the townsite three years ago, this tree, which grew from the seed, has attained this size in less than that time.

San Luis Obispo County Lands. Best and Cheapest in the State. Rainfall abundant. Colony Lots, Farms, Orchards, Stock Ranches, Town Lots, Business Openings, Mines. Offices opposite R. R. Depots, Oceano and Arroyo Grande, Cal. Call or write for price list.—Beckett Realty Co.

Queries and Suggestions

SOIL INOCULATION.

Editor Cultivator: I have seen articles in your paper about inoculating the ground. I would like to ask how the ground is inoculated when potatoes are planted, and also if the ground is treated in the same way for beans, peas and other vegetables?—A. E. P., Anaheim.

Soils are inoculated in various ways and with reference to the particular crop you are planting. It would avail nothing to inoculate for potatoes as the bacteria works only on leguminous or pod-bearing plants such as beans, peas, clover and alfalfa and the same bacteria does not work on all leguminous crops; it is necessary to obtain that which acts upon your particular crop. For instance, did you have a new white clover lawn which was looking poorly though good care was given, you should go to an old clover lawn that looked vigorous, get some of the soil from about the roots of the plants, put same in a pail of water and pour the water over the lawn, distributing it as evenly as possible. The chances would be good for immediate improvement. Field peas, alfalfa and other field crops are inoculated at time of sowing, by soaking the seed in water in which the bacteria cultures have been placed. These cultures may be purchased at seed stores in all large cities.

Inoculation is not always beneficial and adds only to the fertility of soils low in nitrogen and must not be understood as saving the grower any labor, for the same amount of care is necessary as under the old conditions. Experiments have been carried on at a Government farm in Canada with cultures prepared in Germany as well as those obtained from the Department of Agriculture at Washington and their report states that as a result of observations the necessity for inoculation is not as great as was once thought to be the case . In the Province of Ontario, at least, the failures to obtain a good catch of clover have been due to a deficiency of moisture, unsuitable mechanical condition of the soil, or insufficient drainage rather than to a lack of nitrogen-assimilating organisms.

A similar condition was found to prevail in British Columbia, and the conclusion is that the severity of the winter, lack of moisture, uncongenial conditions of soil, or poor seed will be found to militate more against successful clover growing than any supposed lack of tubercle bacteria.

BUDDING LOQUATS.

Editor Cultivator: About Loquats, the seedless variety. In regard to size, are they larger than the old varieties? And are they as rich in flavor? and are they as easily grown? and can they be budded on to trees of the old variety? or do you graft instead of bud? and where could the grafts or buds be had? the variety guaranteed. —A. G., San Bernardino.

Budded loquats are superior in every way to seedlings. The fruits are larger, better fleshed, better flavored and as easily grown. They are budded, not grafted and are for sale by nearly all nurserymen. There are several named varieties, which vary in size, flavor, flesh, ect. These have several times been described in the Cultivator and a note regarding them appears on the cover page of this issue.

RAISINS SEEDS FOR FEED.

Editor Cultivator: Will you kindly give us your opinion of ground raisin seed as a food for dairy cows. It is being offered for sale here, and recommended as being equal to or superior to linseed meal.—S. R., Whittier.

Practical dairymen who have fed raisins seeds do so in the proportion of one-fourth to three-fourths bran. It is so much cheaper than linseed meal that it is used to some extent. Used in connection with a balanced ration it brings good results. It is a very rich, strong feed and must be used with care.

PINEAPPLES.

Editor Cultivator: In regard to pineapples. How much frost they will stand, and what you think of them in the Coachella valley, and where I can get plants.—C. J. B., Thermal.

Pineapples have never yet proved a commercial success in California. Whether they can be successfully grown remains to be demonstrated. Large quantities of young plants are sold from Los Angeles and vicinity, but few, if any, fruits have been marketed. Pineapples will not stand frost and in fact need a climate where the temperature never drops very close to the frost line.

DROUTH-RESISITANT CEREALS.

Editor Cultivator: Seeing in your issue of October 27th an article by Dr. Fairchild, in charge of the work of introduction of new seeds and plants and that he has macaroni wheat, barley or oats which are imported from Algeria, Turkestan and other dry countries ,to be used in our desert, I know of no place other than this valley where a good test could be made of it. I am willing to test some this season, providing I can get the seed. Please direct me how and where to get it.—H J. L., Rosamond.

Write Department of Agriculture, (Bureau of Plant Industry), Washington, D. C.

RASPBERRIES.

Editor Cultivator: Please inform me through the Cultivator which kind of raspberries does best in this part of the country. The yellow or the black cap.

Is there any market for Belgian hares in Los Angeles?—W. O. B.

Yellow raspberries are not generally grown and the red (Cuthbert) is the most popular.

Belgian hares are nearly "a thing of the past" in Los Angeles, though a few are found in the markets.

SILO CAPACITY.

Editor Cultivator: I wish to know the capacity, in tons, of a silo 30 feet deep and 16 feet in diameter.—J. L. P., Santa Ana.

Your silo will hold 119.4 tons.

DOING GOOD WORK.

The Tulare Grange seems to be a live farmers' club. It takes up-to-date subjects for discussion and its conclusions are pertinent and sound.

At its last meeting, for instance, it took up the following points of interest to all farmers in California, viz.: A better system of agricultural education in every department of operative science; a more equitable division of taxes; amended legislation to encourage and provide for better co-operative methods for farmers; legislation which will provide for a more equitable, just and economical distribution of the waters of the State, now so essential to intensive and successful agriculture; legislation which will provide co-operative or State insurance against fire and against the exactions of unscrupulous fire insurance combinations.

Under the head of the "Grange" Mr. John Touhy of Tulare makes the statement which every well advised man will endorse:

"The Order having, as it has, National, State, county and township membership for the purpose of carrying out definite principles and interests, as they arise, can do, and is doing, more than is possible for any local club or organization to do; that for these reasons farmers need the Order of Patrons of Husbandry and the Order needs every former in the State, in its ranks. It was agreed that the time is now opportune for extending the Order in this State, and a committee of three was appointed who drew up and reported resolutions to the officers of the State Grange, urging that efforts shoud be made, now, to increase the membership of the Order in California."

BOYLIKE.

The late Mrs. Mary Mapes Dodge visited a St. Louis family some years ago.

There was in the family a little boy with an inordinately sweet tooth.

"Mrs. Dodge," said the boy's mother one day, "do you think it is right for Bobby to eat so much bread and jam?"

"It doesn't hurt," the visitor answered.

"But all that jam?" complained the mother, anxiously.

"Oh," said Mrs. Dodge, with a grim smile, "he doesn't eat it. He leaves it on the doorknobs."

ONCE IN A WHILE.

Once in a while the sun shines out,
And the arching skies are a perfect blue;
Once in a while 'mid clouds of doubt
Hope's brightest stars come peeping through.
Our paths lead down by the meadows fair,
Where the sweetest blossoms nod and smile,
And we lay aside our cross of care,
Once in a while.

Once in a while within our own
We clasp the hand of a steadfast friend;
Once in a while we hear a tone
Of love with the heart's own voice to blend;
And the dearest of all our dreams come true,
And on life's way is a golden mile,
Each thirsting flower is kissed with dew
Once in a while.

Once in a while in the desert sand
We find a spot of the fairest green;
Once in a while from where we stand
The hills of paradise are seen;
And a perfect joy in our hearts we hold,
A joy that the world cannot defile;
We trade earth's dross for the purest gold,
Once in a while.

—Nixon Waterman in Boston Beacon.

How the Old Man Celebrated

Roseville was asleep in the dullness of Sunday afternoon. In Mrs. Maloney's sitting room there was the odor of strong tea, and that meant that Mrs. Burns and Mrs. Ryan had stayed over after mass for dinner and were having a friendly cup of tea before they started homeward with their husbands. The men themselves were hanging about the village somewhere. There had been silence for some minutes—a heavy, thoughful silence—after Mrs. Maloney's last remark. The good women were relatives, cousins in the first degree, and Mrs. Maloney had been talking of their maternal uncle.

"It's a perfect shame," she had said. "Uncle Martin has a good deal of money saved up, I am sure. He won't spend it himself and he won't give anybody else a chance at it, and like as not, when he dies, he'll leave it to Father Shanahan for something or other that he happens to take into his head. Martin's getting dreadful pious in his old days, since he's been living alone in the little house."

"He hasn't it in any bank in Fairbrooke," said Mrs. Ryan, "because Pat has asked."

"Like as not," Mrs. Burns said, "he has hid it in the house somewhere. He's that queer about it, you never can tell. He's always wishing he had money enough for a trip to Chicago. But the Lord knows that it is he that could go if he wanted to. Not a chick nor a child to hold him."

Mrs. Maloney looked thoughtfully at the speaker. "I saw him get in with the McGoverns after mass. He was going out to the farm to dinner with them. We might walk over to the house, and if he's in, give him a little visit. If he isn't——"

"The key is under the doormat," said Mrs. Burns.

And over to Uncle Martin's the good ladies went. He was not at home, and the key was under the mat. The house, though generally clean, had the air of being managed by a man, which women see at once. The pipe was laid away with the cups and saucers and a pair of shoes stood prominently on one of the chairs. But none of them had any eyes for these incongruities today.

"How much," said Mrs. Maloney, "do you think he might have?" as she drew out a drawer of the old bureau and began going through it.

"A thousand or so," said Mrs. Burns, from the depth of an old rag bag.

"I don't believe it's that much," said Mrs. Ryan, as she went through the old cans and jugs stored in the closet.

They were so busy that they did not hear a step outside, just as the three of them had concluded to look through the corn shucks in the tick.

But all their digging brought forth nothing but a few cents laid away for ready change, less than a dollar altogether.

Red in the face with hurry, and a little bit ashamed, too, they put things back as best they could.

"I wonder where he has it, anyway."

"Do you suppose it is that he really hasn't any, as he says? said Mrs. Burns.

"Pshaw!" said Mrs. Maloney, skeptically.

The next morning, however, Mrs. Maloney was to have more exact knowledge as to the amount of Uncle Martin's money. Her husband, who was the village constable, along with being the biggest storekeeper, came in to her excitedly.

"Uncle Martin was just in the store, and he says somebody has stolen his money. He says there were signs of somebody being in his place when he came home yesterday evening, and he thinks he can find out who it was."

Mrs. Maloney was skimming the soup, and she almost dropped the ladle. After a few moments she managed to control herself enough to ask:

"How much does he say he had?"

"One hundred and fifty dollars. I would have thought that he would have had more." But Mrs. Maloney made no protest. She was suddenly thankful that the old man was satisfied with that.

"And then, think," went on her husband, "of the shame of the town. There hasn't been anybody in the jail for more than five years—not since—"

Mrs. Maloney interrupted him: "What's Uncle Martin going to do about it?"

"He's gone off to see if he can get some evidence. He has a suspicion who it is; he's going to be gone until this evening, and then he's to let me know. He's——"

A summons from the store came just then, and Mrs. Maloney was, fortunately, left alone.

"He must have seen us," she moaned, as she dropped into a chair.

After dinner she went out and hitched Jenny to the road cart, telling her husband that she was going for a little drive. Once out of sight, however, she made Jenny fly.

There were tears and gnashing of teeth in the Burns and the Ryan households, but in the end the butter money was produced, and, added to what Mrs. Maloney had saved by odd dressmaking jobs in the village, the guilty woman managed to get the $150 together.

Toward six o'clock Mrs. Maloney slipped into Martin's little house and put the money into the tick. The next morning early, when the Maloney's were at their breakfast, Uncle Martin appeared, chuckling. It was in the straw tick," he reported, truthfully enough. "Moved about a little. I guess I've made up my mind to take that trip to Chicago. I am so glad after my scare, that I feel like celebrating. And you never can tell what may happen," he went on chuckling anew, and looking at his niece.

"That's right, that's right," said her husband. "You might as well have the good of it yourself. You worked hard enough for it."

Mrs. Maloney choked and set down the cup of coffee she was drinking, and rose hastily from the table. Uncle Martin looked on sympathetically.

But the chagrined and angry woman had one consolation. She knew that there were two others no less uncomfortable than she to find the old man going merrily to Chicago on their hard earned money.

Alas, curiosity is the ancient sin of woman, and it seems to take many lessons to break her of it.—New York News.

FROM A HAPPY HOME.

I've heard so much of the bad husband and the indifferent husband, let me tell of the good husband, for that is the kind I have. Just here let me state that he is not faultless, O, No! but he is one of the best husbands on earth. To begin, he loves me! How do I know? By the way he treats me, and, he does not forget to tell me so. It's 20 years and more since we stood at the altar and vowed "for better, for worse, for richer, for poorer" and today he is more the lover than then. He does not consider it anything to be ashamed of to kiss me, or to place his arm lovingly around me and say, "Bess dear, I love you." Naturally he is very quick tempered, and so am I, but before we vowed to love each other till death do us part, we talked the things over, and decided that neither of us were perfect but that we would strive to so live that we would overcome our failings and we neither one felt then or now feel it a lessening of our dignity or a weakening of our love to beg pardon if we have been wrong; and as the years glide by, the necessity of begging absolution for hasty words is growing beautifully less. I have frequently heard my husband say: "Bess never says anything when she gets mad. She whistles or sings." Dear sisters, isn't that better than "saying things" that hurts your own self-respect, and also your dear ones' love and respect? For just as surely as two and two are four, so does "constant dropping wear away a stone." And no husband can love a wife he does not respect. Never forget that, dear young sisters who have just become wives, or are contemplating it. Respect is the fundamental

Widen
The Circle

There is no better way for the farmer to widen the circle of his influence than to join with his neighbors in building a telephone line. It extends the neighborhood circle and enables each one to receive advantages that cannot be had in any other way. The cost is meager compared with the benefits of a good telephone line, and progressive farmers, who are awake to their own interests, are building many such lines.

Stromberg-Carlson
Telephones

are used on nearly all farmers' lines because they have been found to be the most suitable telephones for that purpose. It don't pay to experiment when you can get Stromberg-Carlson Telephones and be sure of good service. Start off with the best and your line will always work satisfactorily. You will also avoid the expense of changing instruments in a few months. Book 71-I, "How the Telephone Helps the Farmer," tells how to organize, build, and operate a farmer's line. It's free, and every farmer should have a copy.

of love, and if you do not respect yourself, be sure others will not respect you. I do not mean that a wife should blindly submit to anything and everything because the husband says so. No! But, if no principle is involved, better submit then wrangle. But if it is a principle, set your colors and "stand by."

My husband does not feel it beneath his dignity as a man, a "Lord of Creation," to occasionally sweep the floor, help with the dishes, or wash and dress the baby. He has frequently washed the most dirty clothes on a washboard at that, for I do not have a machine. He always wants me to go with him when he has to go anywhere, and I nearly always do, for the work will wait, and be right here when I get back to it. And he says he married for a companion not merely a housekeeper, and would rather have a jolly, happy wife than all the pies, cakes and fancy cooking on earth. And it is a "heap sight" easier to be jolly, at least for me.

When we get hard pushed with out of door work, I gaily don an old dress (I have never tried overalls, but I may) and sally forth to drive team and help. Listen, O Ye sisters who think one can't do work outside and still be gentle and womanly. I have done a little of all kinds of outdoor labor, from breaking a "broncho" to turning the grindstone at the "round-up." I can, if necessary, cut out and brand, rope and throw with any of the men. I can run a mower, and what is harder, keep it in good running order; can break prairie sod, plow, cultivate and gather corn—in fact, do nearly any kind of out-door work, and yet I am called a good cook a good housekeeper, a fair musician and singer, am a first class dressmaker, a good milliner, in short can do most any kind of work even to taking care of and training children. One of the finest compliments I ever received was from a little neighbor boy to whom I had given a kitten I had reared and trained. Some time afterward he said to his mother, "Well, mamma, Mrs.————knows how to raise cats as well as kids to mind without howling." One of my pet ideas is to rear children to obey, and not to cry—to be what you want them to be, not what they can be without training. If the sisters desire me to I will come again and give my ideas on child bearing and training. Also, if further ideas are wanted on husband and wife training. I can see some noses and heads going up in the air. "Humph! husband and wife training indeed! I guess we know enough without any old hen telling us. We are grown." No, no, dear ones we are all little children, and must continue to grow till we reach the fullness of the stature of Christ Jesus, else we would be only little children, forever to be led, and never to lead. It takes more than four walls to make a home, and it takes more than a being in trousers or dress to be the ideal husband or wife, the proper material for parents, and a child has a right to be well born. If I escape entire annihilation this time I may return.—Bess.

A fever patient can be made cool and comfortable by frequent sponging off with soda water.

Warm borax water will remove dandruff.

HOW TO CLEAN RIBBONS.

Never throw away a ribbon until it is worn and threadbare. I use the same ribbons year after year and they always look fresh and new for a long time. First take a soiled ribbon and after wetting it in cold water put it in a basin of soapy, hot water and let it stand. When the water has cooled to about blood heat, take a table—marble topped, if you have it, if not, spread a clean cloth upon table and upon it stretch the ribbon, having it perfectly smooth. Then take a whisk broom or brush and clean the ribbon brushing it with the grain but never squeezing or crumpling the ribbon. After turning it and brushing it well, using plenty of water until all dirt is removed, then take clean, cold water and brush it well with that. Then take the ribbon and put it in clean water, lifting it upand down but never squeezing it. It is necessary to rinse through several waters or the ribbon will be stiff and not soft like new ribbon. Lift the ribbon from one water to another then stretch upon a clean cloth and place in sun to dry. When nearly dry, place even and smooth between a cloth and iron dry.—Mrs. Lulu G. Powers, Mobile Co., Ala.

A HINT ON SWEEPING.

Fine dust raised in sweeping is most unpleasant. When sweeping have a pail half full of very warm water in which put a little ammonia. Before beginning dip the broom in this, shaking as dry as possible. When broom becomes filled with dust dip and shake as before. The damp broom holds the dust which would otherwise fill the air. By changing the water often no injury will come to the finest rug or carpet. Ammonia brightens colors and they look much cleaner than when swept in the old way. The labor of dusting is greatly lessened, and germs are disposed of.

When grip and colds were prevalent in the neighborhood, not one of my family suffered from either. It is worth trying.—Successful Farming.

FACTS WORTH KNOWING.

Hot lemonade will relieve a cold or cough.

The skin of a very fresh egg will relieve sea sickness. From one to three will be sufficient.

Dish cloths should be boiled in borax water at least twice each week to keep them perfectly sanitary.

A tablespoonful of borax is an agreeable addition to the dishwater and helps to keep the hands soft, instead of irritating them as soda does.—Press.

Ostrich plumes that have become soiled or faded may be cleaned and made new for trimming this winter's hat provided one knows how. Make a bowl of clean suds with soft water and ivory soap and soak the feather 15 minutes. Then strip it between the thumb and finger till clean. Rinse and dry before a slow fire or in bright sunshine, and while drying keep the feather continually moving or shaking; that is what makes it curly and fluffy.

Kerosene when used as a cleaning agent is a great help to the housekeeper. It is excellent for cleaning windows and mirrows when they are not very badly soiled. Put a few spoonfuls in a pail of water and wash the glass with a soft cloth dipped in it. Use no soap with kerosene.

Bath tubs, iron sinks, zinc covered tables and zinc under the stove are readily cleaned by rubbing them with a cloth dipped in kerosene until the dirt is loosened and then washing it off with strong pearline suds.

GIVE OTHERS YOUR SUGGESTIONS.

The household department of the Cultivator is especially the property of the wives and daughters of the Cultivator. As such it is their medium of communication. Its columns are open to them for the expression of their opinion on all subjects relating to the home.

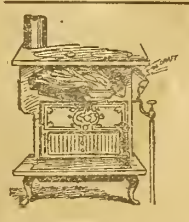
We shall be glad to receive communications, letters of suggestion queries, and every other good thought that may tend to encourage the woman toiler on the farm. Do not be timid about writing, send in your suggestions and we will see that they appear all right.

TO CLEAN FELT HAT.

Editor Cultivator: Can you please tell me what I can clean my last winters white felt hat with. It is just dusty and discolored slightly from wear but as yet I have been unable to find anything that will clean it.—P., Santa Rosa.

Sprinkle powdered French chalk well over the hat and brush thoroughly with fine brush. Repeat the operation until the dust is removed. If you have been using any liquid on the hat it is probably past help.

The largest and most comprehensive natures are generally the most cheerful, the most loving, the most hopeful, the most trustful.



BURN AIR AND SAVE FUEL

You can do it with the

VINEYARDS FROM CUTTINGS.

(Continued from First Page.)

successful as this but I am thoroughly convinced that this is at least one of the right ways.

A cutting placed in vineyard row and allowed to grow undisturbed usually forms a better root system than it will do if transplanted from the nursery. I once had occasion to dig up several hundred vines of each after growing in the vineyard two years and found this to be almost invariably the case.

RYE—Good to choice, per ctl, nominal; new, $1.45@1.52½.

CORN—Good to choice, per ctl: California, new, large Yellow, nominal; small do, $1.60@1.65; White, nominal; Eastern Yellow, $1.40@1.42½; White, $1.32½; Mixed, $1.35@1.40.

CITRUS MARKETS

The new crop navels are now moving eastward at the rate of some fifteen cars daily, while old crop Valencias are practically gone—the high prices being maintained to the last, the sum of $3095.91 being gross amount received for a car of Old Mission brand Valencias last Thursday in New York, while the last car of Old Missions was sold Wednesday for the magnificent sum of $3668.65, the average for the entire car being $8.83 per box. The new navels are arriving in good condition for this date and bringing good prices.

New York.

One car of Valencias and one of lemons sold Friday. The oranges were from the Arlington Heights Fruit Co. and ran from $3.62 to $6.25 per box. Lemons brought $4.57@5.04.

Monday one car of new crop navels was offered, the fruit immature, and sold for $2.10@3.05. Altland Fruit Co. shipper. Two cars of Valencias were sold at high prices. Old Mission and Portesia brands bringing as high as $10.12½ per box. Four carloads of lemons were sold at the following averages: Silver, Ar. Hts. Co., $3.95; Squirrel, fy, A. H. Co., ½s, $4.94; Warrior, ex ch, Stewart Ft. Co., $3.40.

No oranges offered Tuesday, but three cars of lemons commanded good prices. Flower, fy, Upland, averaged $2.50; Mallard, fy, No. Pomona, $4.39; Santa Paula, fy, $3..67.

One car of Old Missions sold Wednesday at an average of $11..92 for fy, $8.58 for ch, while Artesia, A. H. F. Co., Prenda, brought $10.34 for fy and $5.50 for ch. Two cars of new navels arrived from Exeter in good condition. Prices: Mariposa, fy, Exeter, $3.82@$3.25; Moore Estate, fy, Exeter, $4.35@2.50.

Chicago.

Lemons Friday in over supply, but sold fairly well; 360s, $4.50@4.75; 210-240s, $4@4.50; 420s, $4@4.25.

Oranges steady with light supply. Valencias, $5@6.

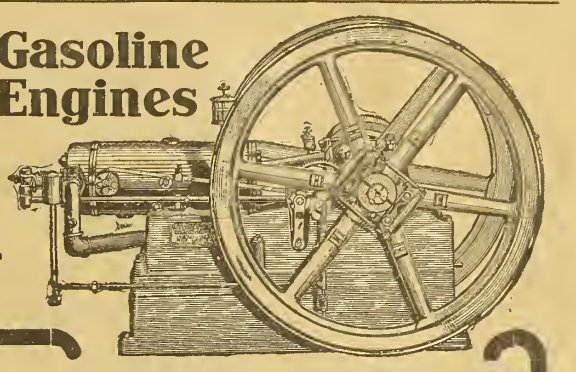
New crop navels on the market Monday, well colored and nice, with steady prices. Lemons unchanged. Old Valencias Tuesday brought $5@6, while lemons were steady at followig prices: 360s, $4.25@4.50; 300s, $4.50@$4.75; 210-240, $3.75@4;420s, $3.75@$4.00.

New navels Wednesday sold for $3.75@4 per box.

Lodi sends the following summary of the cars shipped from that point during the season of 1905: 600 cars of table grapes, 400 cars of wine grapes, 35 cars of tree fruits, 40 cars of almonds, 150 cars of grain, 50 cars of hogs, 135 cars of melons, 3800 cases of eggs, 30,000 chickens.

I. H. C. Gasoline Engines

Best For Irrigation.



WHEN it comes to pumping water for irrigation purposes the "I. H. C." Gasoline Engines will be found the **simplest, safest** and the most **durable and economical.** They can be attached to any kind of pump, in any position, for raising water from deep or shallow wells, reservoirs, canals or running streams. They excel in **full, regular and long sustained power.** They can also be used for a general purpose engine for sawing wood, churning, cream separating, feed grinding, etc. They give the maximum of power at the minimum cost. No expert knowledge or trained engineer necessary to operate them. They are unequaled for power of all kinds. Made in a variety of sizes and in two styles. **Horizontal or Portable 6, 8, 10, 12, 15 Horse Power. Vertical, 2, 3, 5 Horse Power.**

Call on local agent and examine these engines or write nearest general agency for illustrated catalog showing how they will save you money.

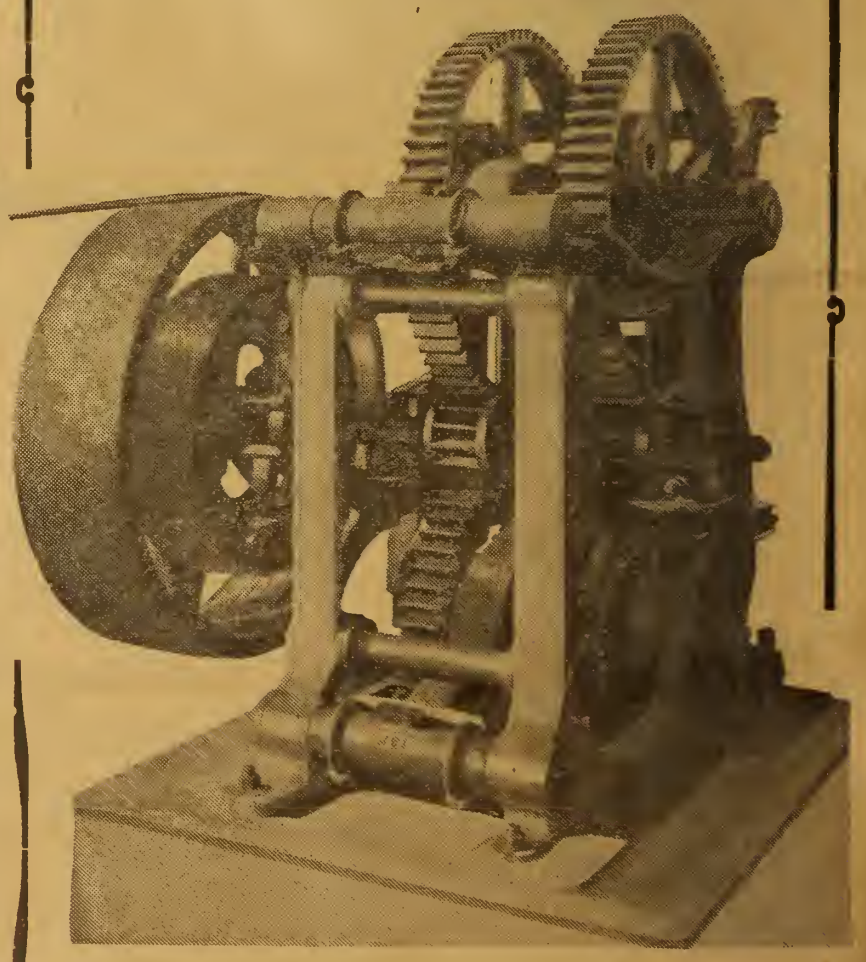
The Record for the New Pomona Pumps

FOR 1905

Not a Broken Rod, Not a Plunger Pulled for Repairs



The irrigation season just closing has demonstrated fully the high merit and efficiency of the New Pomona Pumps.

Every one installed has passed through the season's run without breaking a rod or requiring the valves to be pulled for repairs, proving conclusively that the ideal beam motion used by these pumps is more than has been claimed for it.

The slow, uniform motion upward and the quick, smooth down motion handles the rods without any jerk or jar, while the long lap of the plungers in passing the dead points, keeps the water column in continuous motion upward and a steady stream flowing from the discharge pipe.

They have passed through the experimental period and are built better than ever for next year.

The ideal pump for irrigation purposes. Send for catalog.

THANKSGIVING SCENES IN CALIFORNIA

FROM THE PRESIDENT'S PROCLAMATION.

"During the past year we have been blessed with bountiful crops. Our business prosperity has been great. No other people has ever stood on as high a level of material wellbeing as ours now stands. We are not threatened by foes from without The foes from whom we should pray to be delivered are our passions, appetites and follies; and against these there is always need that we should war.

Therefore, now I set apart Thursday, the thirtieth day of this November, as a day of prayer for the future, and on that day I ask that throughout the land people gather in their homes and places of worship, and render thanks unto the Most High for the manifold blessings of the past year."

CIRCULATION EXCEEDING 10,600

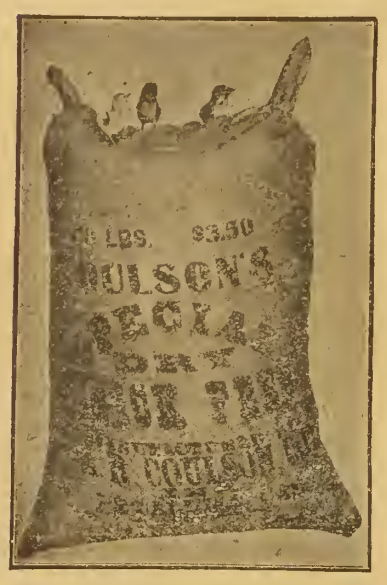
Look for a Little Envelope in the 100 Pound Sacks of

Coulson's Special Chick Feed

——For Little Chicks and Turkeys——



You will have the best success you ever had in raising chickens if you will feed COULSON'S SPECIAL DRY CHICK FEED. Send for sample. It's good for turkeys as well.

This Chick Feed is composed of small pieces of cracked grains, also a variety of seeds and small pieces of charcoal, meat and bone. It therefore contains a variety of the best and most wholesome ingredients in the right proportions to promote the growth of chicks and turkeys and fully nourish them so they will reach maturity early, and be vigorous, strong, healthy birds.

ECONOMY IN USING COULSON'S SPECIAL CHICK FOOD.

By a series of tests it is found that chicks will gain weight much quicker on COULSON'S CHICK FOOD, AND at less cost than those fed on grain.

Chicks fed on COULSON'S CHICK FOOD will reach the weight of two pounds a month sooner than those fed on grains, and they will reach the average weight of three pounds eight weeks sooner.

It is the knowledge acquired through patient study and keen observation which enables us to give the proper feed to poultry in order to raise the largest percentage of the chicks hatched. With COULSON'S SPECIAL DRY CHICK FOOD and COULSON'S GROWING CHICK FOOD many succeed in raising from 95 per cent to 98 per cent of the chicks hatched and you can do as well. TRY IT THIS YEAR.

Mr. Poultryman, there is only one way to buy, and that is, on record of what you want. If you want to raise lots of nice chicks, buy good feed.

COPIES OF LETTERS RECEIVED.

I have fed your Chick Feed since I started this place about September 1st—last—and have sold 3,400 chicks and have 800 on hand now.

A. Mc HORTER.

I like your Special Chick Food better than anything I have ever used.

MRS. GEO. THISSELL, Jr.,
Winters, Cal.

$500. What about it?

I have used your Special Chick Food since last March, and am still using it (July 7th). I believe it to be all right. I have lost less chicks than other years. It is good—the best I ever bought.

R. A. WHITFORD.

I had read so much of your Incubators that I thought I must try one, and I am more than pleased with the one I bought. I have also tried your Chick Food and think it fine. I have to go twenty-two miles to get it.

MRS. MAY LYMAN,
San Bernardino, Cal.

I have used your Special Dry Chick Food and recommend it to all my neighbors.

MRS. IDA L. PARKER,
Eureka, Cal.

I think your Chick Feed is fine. I never lost one while I fed it, and never saw chicks grow so fast in my life.

MRS. HATTIE DEAN,
Mesa, Washington.

Our chicks are doing splendidly on the Special Chick Food. No losses except by accident.

J. HUNTER.

COULSON'S FOODS GIVE BEST RESULTS.

I am a user of Coulson's Chick Food and have raised 1100 chicks this winter. The first hatch I used some other food and lost over sixty. My second I raised on COULSON'S CHICK FOOD, according to directions, and lost only ten. Then in my third hatch I fed COULSON'S CHICK FEED—dry—three times a day for three weeks, and out of 394 chicks, I lost only two, and all are doing fine. Now, chicken raisers in this locality are wondering at my success, and I am praising COULSON'S FOOD as much as I know how. (Signed) F. E. HEUSEL,
Half-Moon Bay, Cal.

We receive much praise for this Special Chick Feed for it pleases the poultrymen and it pleases the chicks.

Many of the large poultry raisers near Petaluma purchase the Special Chick Food by the wagon load.

COULSON'S CHICK FOOD

Contains ingredients that long experience in poultry raising has found best adapted to give nourishment to growing chicks. It is promptly digested; causes no indigestion; keeps bowels in normal condition. Chicks show increase in weight, strength and beauty when fed it exclusively. Little chicks need no other food for the first five or six weeks. Save your chicks and make good profits.

Keep them from bowel trouble and all ailments incident to the first five weeks. Profit lies in the chicks you raise to maturity—not in the number hatched. Give them a ration that makes healthy, well developed bodies.

Remember Mr. Bassett sold broilers only six weeks old for $3.75 a dozen. They were fed on Coulson's Chick food

BEGINNING LIFE ON COULSON'S CHICK FOOD.

TEN WEEKS OLD CHICKS RAISED ON COULSON'S CHICK FOOD.

There may be a pleasant surprise in store for you. You will find it in the 100 lb. sacks.

Send me another sack of Coulson's Chick Feed. It seems to be just th thing for young chicks, they are doing fine —H. A. DUN, Tacoma, Wash.

Tulare County Hardpan and Hogwallows

By H. D. Barton, Orosi

The conclusion I have reached as to the manner of the formation of hardpan and hog wallows is partly the result of what I have read, but mostly the result of my own observations. In the first place, to make the subject intelligible, let us take a look at the constituent parts of the material or rock from which the soil of this valley is formed. The rocks, the disintegration of which is making this valley, are all primary or transition, they all having been thrown up just subsequent to close of the old red sand stone or Devonian, and near the middle of the Palaeozic period and some erupted or volcanic matter. Of these rocks the predominating minerals are feldspar, hornblende quartz, and mica, in the order named. Now the component parts of these minerals are Feldspar, Sp. Gr. 2.54, composition: Silex, 62.83, alumine, 17, potash 13, lime,3, iron 1. Hornblende, Sp. Gr. 3.38; composition: Silex, 47.21; alumine, 13.94; lime, 12.73; magnesia, 21.86; oxide iron 2.28; oxide manganese, .54; flouric acid, 90; water .44. Quartz, Sp. Gr. 2.63; composition: nearly equal parts oxygen and silicium. Mica Sp. Gr. 2.7; composition: Silex .48; alumine 34.25; potash 8.75; iron, 4.5; maganese, .5; water, 1.25.

These are the principal minerals that constitute the rocks that form the Sierra Nevada mountains. Of course, there are a great variety of other minerals in greater or less quantity but these predominate and are all that is necessary to make hardpan, and hog wallows. As all of these primary rocks are in their highest state of oxydization, further decay is impossible. A cubic foot of granite is said to carry about a hundred pounds of oxygen in a concentrated form, the manner of which, is not yet understood. It is necessary, at first, for these rocks to disintegrate mechanically, that is, by the agency of heat, cold and moisture, penetrating the surface and separating the crystals. When some of the flourine acid of the hornblende is liberated it attacks the silex of the feldspar, dissolving it and forming clay. The silex of the hornblende is also dissolved and this being nearly one third heavier than the other material when it is carried to the plains by the water is thrown down along the foothills ,and forms what is called dry bog. The lighter material is leached out and carried farther away. We now have liberated all the material necessary for the formation of hardpan and hog wallows. Various causes have been assigned by different scientists for bringing about these little knolls. As a result the idea that they were thrown up by squirrels or other burrowing animals, is a common one. Even the ant is supposed by some to be guilty. That wind blowing loose sand that lodged against certain shrubs, said shrubs having long since disappeared, is thought by many to be the cause. Even Professor Goodyear, the state mineralogist supported this theory. That they were formed under water by the action of waves when this valley was a sea is also argued. We had just as well overthrow this last theory right here. The glacial epoc was just subsequent to the time that the sea covered this valley. On the north side of King's river and extending for several miles out on the plains is the part of a terminal moraine. The river has cut through it and has washed the greater part of it away and the river channel now is several miles from the lower end of the moraine, and between them is the old river bottom, with a substratum of round washed river boulders. Overlying these boulders is the common red clay of the plains with hardpan and hog wallows. Another theory, hardly worth notice, is that they were formed at the same time and by the same forces that uplifted the adjacent mountains. We have the authority of the historian, Huber H. Bancroft, that they are the work of a race of prehistoric men, he giving room in his "Antiquities of the Pacific Coast" for a writer to describe them as artificial. Finally, there is the igneous theory, which is attributed to Humboldt and supported by nearly every one who has excavated them, while it is found that all the more abrupt knolls possess a crater that reaches through the hardpan. On account of their resemblance to the fumaroles which Humboldt saw in the vicinity of Mt. Jurollo in Mexico, he attributed the same origin to both. The difference is this: the fumaroles are round, with the highest point in the center, while the hog wallow is rather oblong, with the highest point at the north end. Hardpan, which is the first cause of the hog wallow, is composed of our ordinary red clay soil, cemented together with hydrous sesquoxyd of iron and carbonate of lime. It is formed partly by evaporation and partly by the water from below carrying the lime and iron coming in contact with the rain water from above, carrying carbonic acid. The lime and acid unite, forming carbonate of lime, and this is the process by which hardpan is formed. During the floods of '62 and '68, and before the channel of the St. John was cut down, the Kaweah rivers swept bare several acres of hardpan, just above the Venice hills. The surface of the harpan showed here to conform somewhat to the original surface of the soil usually showing a hole or crater, some two or three feet in diameter, near the north end of each hog wallow, extending down clear through the hardpan. The walls are smooth and hard, except the north side, where they sometimes are broken and uneven, probably the result of the north side being more

SMUDGING FOR THRIPS.

Editor Cultivator: Would be glad to know if smudging has been tried for "thrip" and whether sulphur could be used in conjunction with some matter to cause more smoke. Would like suggestion as to best and cheapest vessels to put it in to cover a fifteen acre prune orchard.—F. L. O., San Jose.

Smudging would be of little use in reducing the thrips pest, the use of sulphur as suggested might be of service in reducing it, but the best remedy as yet is spraying with some of the oily washes, as kerosene emulsion, or whale oil soap just as the buds are swelling, but this is only a partial remedy. Dudley Moulton, entomologist of Santa Clara county, who has made a special study of this pest, recommends winter plowing, with careful working around the trees which will kill the immature form. This work should be done before the first of February, at which time the mature insects begin to come out of the ground. We have never tried the sulphur smudge, but think that burning sulphur covered with damp straw, as used in ordinary smudging, would increase the volume of smoke.

* * *

TOKAY GRAPE SHIPMENTS.

It is said that it is an ill wind that blows no one good, and so in the present season of late rainfall, while the stock and dairy men and the miners are praying and suffering for rain, the growers and shippers of table grapes are returning thanks, as their season has been very materially lengthened and their profits increased. The shipments of table grapes from Northern California will total up some two thousand carloads for the season, and the prices, which have been received, are even satisafctory to the growers—and that is saying much. Many Tokay vineyards have returned $300 and upwards per acre, and reports have been made of some which have exceeded $700. The Tokay is the best export grape grown in California today. The berries are large, the clusters of great size, the color very attractive, and the shipping qualities superior. All these combine to make it profitable. It is also a heavy bearer and gives a certain crop almost as regularly as the seasons. To attain best results, however, it demands suitable soil and climate, a deep, sandy alluvium, such as is afforded by the river bottom lands of the Sacramento and San Joaquin valleys, with continued hot weather and abundant sunshine in the ripening season. The best and principal Tokay section so far known, is found in the northern part of the San Joaquin and the southern end of Sacramento counties. This area will be greatly enlarged, however, if the high prices continue, which is quite probable, as there are very large areas in other parts of the State where the Tokay will do equally well.

* * *

SACRAMENTO ORANGES FOR AUSTRALIA.

Sacramento county is not usually placed in the list of citrus fruit producers, yet a good many oranges are grown here, and not for mere curiosity, either, but as a commercial proposition. A shipment of four carloads of oranges are being packed at Orangeville, which will be shipped from San Francisco on the 20th inst., for Australia. The pioneer shipment to this destination was made from this section a year ago, and consisted of one carload, which gave such good results that the order has been quadrupled this year. This shipment will be made up from the orchards of William Calder, D. D. Harris, G. M. Mott and Jones & Givens.

* * *

BLESSINGS IN DISGUISE.

Very many of the apparent ills which befall us are really blessings in disguise, and one of these is the decadence of the great wheat industry of our State. In the early days, with a virgin soil, of seemingly unlimited fertility, wheat growing was enormously profitable, and the pioneers in that industry made a mint of money, which they regularly invested in more land, until vast areas of the best lands of the State were rolled up in the possession of a few individuals, and there was little hope for the small farmer. In Colusa and Glenn counties, especially, the population steadily decreased as one after another of the smaller holdings was absorbed by the wheat lord. But year after year of continuous cropping to wheat gradually exhausted the soil, and each year it gave smaller returns, while other countries produced a greater quantity for the world's market and prices declined as the crops grew smaller until wheat growing became a losing business. Those who were in it had their all invested in land, and teams and machinery, and they were compelled to keep on even at a loss, or sacrifice all. The result of all this has been that the land grabbers have found themselves in a tight place and are now eager to let go, and the great wheat ranches of the Sacramento valley are being cut up and once again settled in small homesteads. In connection with this movement, there is a strong agitation in favor of a grand system of irrigation by which the whole of the arable lands of the Sacramento valley, comprising 2,661,120 acres, can be put under ditch. Two new canals have been opened by private enterprise during the past year, and the great Central Canal, which has been tied up for years by obstructionists in the courts, is being finished, and efforts are being made for government assistance in converting the Big Valley, on Pit river, into a reservoir site to conserve the winter rainfall. That all this will be done is unquestioned, it is only a matter of time, and then in the place of miles and miles of wheat stubble, we shall have the valley dotted with thousands of prosperous homes, supported by all kinds of industry. Population is coming, and coming fast, and there is only one California, and all sane people want to come here. We have got to make room for them in every corner of the State, and even then we may not have room enough for all.

* * *

INCREASING IMPORTANCE OF THE FIG.

Very little is said about the fig, yet it is steadily increasing in importance as one of the horticultural products of the State. Each season sees a very large addition made to the acreage in this fruit, especially in the Sacramento valley where it is steadily growing in favor, as it is also in some portions of the San Joaquin. Very much of this popularity is due to the introduction and establishment of the fig insect, which has made possible the production of the choicest varieties of commercial figs. The largest plantings of Smyrna figs have been made in Tehama county, especially in the vicinity of Corning, and in Stanislaus county; in both of which sections some solid orchards of figs comprising a very large acreage have been planted. This fruit is paying well, and there is undoubtedly a good future ahead for it. So far the greater part of the pack of figs of the White Adriatic variety; not a first-class fruit, and which has the bad habit of fermenting and souring at the blossom end, but even now the pack is a very important one and ranges from 5,000,000 to 8,000,000 pounds annually. As showing the profit from the common fig, it may be stated that F. S. Jones of Cordelia, Solano county, netted this season $150.00 from eight trees. The Smyrna should do even better than this, and as the output and pack increases, and it becomes popular, as it will when it is more widely known, a new and very important fruit industry will be developed.

* * *

DATES IN FRESNO COUNTY.

From very much that appears in the press in relation to dates and their planting on the Colorado, it might be supposed that this was altogether a new thing in California. Such, however, is not the case, for we have never been to an agricultural fair in California in the past thirty years that some one has not had a bunch of dates, and usually very good ones, on exhibition. They have not been grown commercially for several reasons; the climate in the valleys is against them, and little has been known of their culture and the varieties which would do best and give proper returns, and even less has been known as to their packing and marketing. The date is a new fruit commercially, and everything about it has yet to be learned, but that it will grow and do well in many parts of the State, has been amply demonstrated. As we write, we have before us some dates grown by George Roeding, in Fresno county. The fruit is large, well shaped, with small seeds, a large proportion of meat, and of as fine flavor as any imported figs we have ever eaten. Mr. Roeding, writing of them, says: "It is not the first season that I have produced these dates in Fresno, but I have never succeeded in harvesting so many of them. We have probably gathered, so far this year, one hundred pounds. Of course the palm which has produced these dates originated from a seed. As far as this locality is concerned, date culture has no commercial importance, for as a rule the rains come too early and cause the dates to rot." Date growing is, therefore, not an experiment in California. What now requires to be determined is where we can grow them successfully as a commercial proposition, and the experiments now going on on the Colorado river may solve this question and add another important branch to our varied horticultural interests.

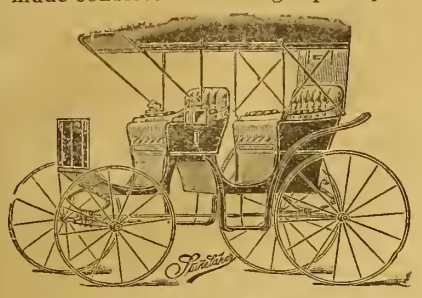
VEHICLES HARNESS IMPLEMENTS

We Carry a Complete Line of Standard Buggies and Wagons, Single and Double, Light and Heavy Harness and Farm Implements of Every Description

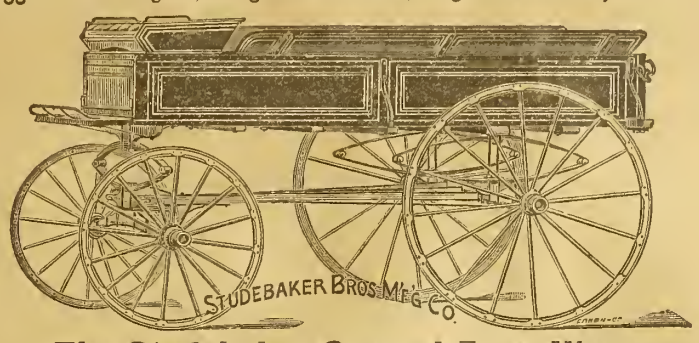
Our prices are as low as can be made consistent with high quality.

Our goods are all guaranteed to be rictly first-class in every respect.



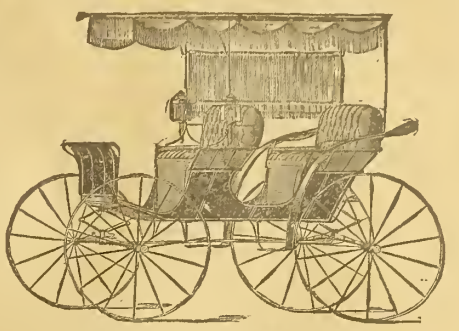
Studebaker Surreys

Are the ideal family buggy. They are well built — not merely thrown together. We carry them in either canopy or extension top; steel or rubber tires and can be fitted with a brake at slight extra cost. PRICES, **$175.00** and up.



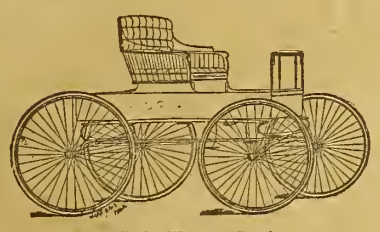
The Studebaker General Farm Wagon

Is made to meet every requirement on the farm. It is strongly built of the best material and the parts are assembled and adjusted by experienced wagon makers. Body equipped with wings and drop endgate. It is a thoroughly practical vehicle and one that has given perfect satisfaction. PRICE, **$57.50.**



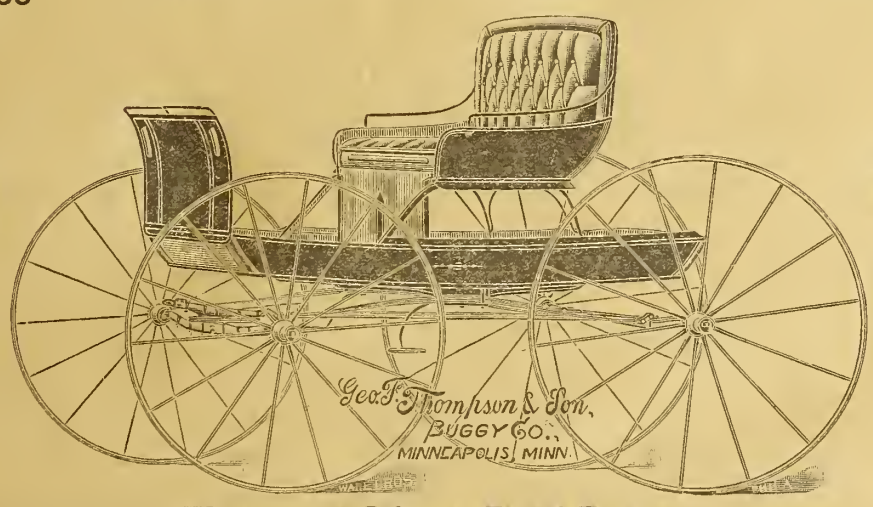
Studebaker Surreys

Have long running axles, 1 1-16 inch, wheels are 3 feet 10 inches high. Body is painted black, gear dark green or carmine, neatly striped. Leather trimmings, double fenders and lamps. Complete with shafts and quick change couplings. PRICES, **$175.00** and up.



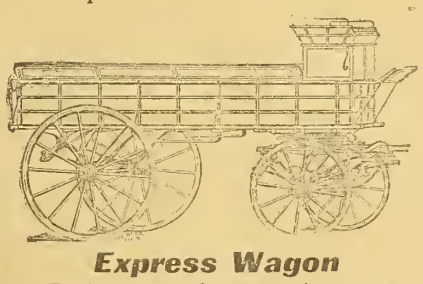
Light Roadster

A well-made, light buggy, built for speed and comfort; steel spokes, rubber tires, leather trimmings, 1-inch axles. Neatly painted and striped. PRICE, **$60.00.**



Thompson Climax Road Buggy

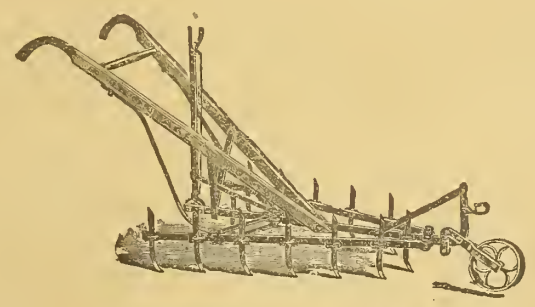
The famous Thompson Climax Road Buggy is guaranteed to be well made throughout and to stand any use to which a buggy of this character is usually put. One and 1-16 inch long distance axles; leather trimmed. Painted carmine or yellow and artistically striped. Body 29x60 inches. Everything complete for service and durability. A good road buggy at a medium price. PRICE, **$80.00** and up.



Express Wagon

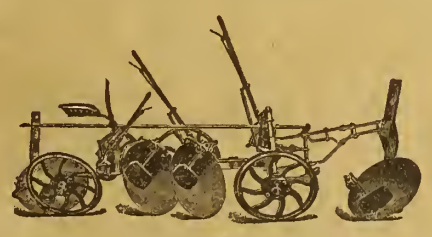
Designed for farm or city usage. Spokes firmly adjusted; tires doubly secured. Every part is fully tested before assembling. A thorough, serviceable wagon. PRICE, **$100.00** up.

We have a complete line of light vehicles suitable for children's use. They are strongly made with special care for the safety of the little folks. Durable and light running. PRICES, **$60.00 TO $100.00,** high grade.



Iron Age Harrow and Cultivator

A well-made implement selling at a low price. Teeth are securely fastened, but may be removed at will for close or narrow work. Easily adjusted to any gauge and securely held in place by lock attachment. PRICE, **$5.50.**

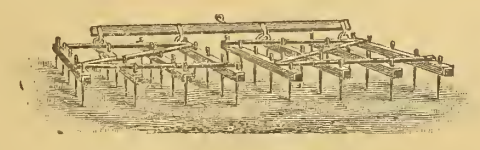


Emerson Disc Plow

The most improved plow on the market. May be converted from single to double or triple, or from double or triple to single. Adjustments are simple; levers within easy reach and bearings are dust proof. PRICES, **$65.00 TO $120.00.**

Harness Department

We carry a complete line of harness, including the famous Studebaker and Kipper makes. It is stitched on the latest Campbell lockstitch machines, making it stronger than if stitched by hand. Double and single, light and heavy. We also are prepared to furnish estimates and execute orders for any special kind of harness. All work thoroughly warranted. Every set carries our guarantee.



Steel Frame Harrow

This is a very popular low-priced harrow, having tooth bars either "zig-zag" or straight. Made in three sections of 20 teeth each. Well made and serviceable. PRICE, **$12.00.**

Our Catalogue

These are but a few samples of the immense stock we carry. Our catalogue will be sent upon request. It contains illustrations of buggies and wagons, farm implements of every description, harness of various weights and quality, together with accessories and smaller farm and orchard tools. It is complete in every particular and will be found very useful in making your selections. You should secure one for reference. All prices quoted.

Our Policy

Is to give full value for money received. We guarantee everything to be as represented and will make good any break not caused by misuse or neglect.

We want you to feel that we are glad to see you at our salesroom whether you buy or not. Always call upon us when in Los Angeles, and we shall be glad of the opportunity of showing our immense stock. We are near the center of town and within easy walking distance of all the leading hotels.

TIME TO PRUNE PEACH TREES.

We have had several inquiries as to the proper time for pruning peach trees in relation to getting a heavy setting of fruit. Some growers claim that if they could prune after the blooming period, they could do it more intelligently, pruning long when blooms are few and shorter when plentiful.

This is easily and safely done on a small scale as with the "home orchard" or small acreage, but it is too expensive to be carried on in large orchards. Pruning is an expensive part of deciduous fruit growing and in order to do it economically, it must be done at a time when other work does not interfere and when no leaves are on the trees, as this makes more rapid work possible. By observing closely the setting of buds, as much can be gained as a guide as to wait till the bloom opens. The setting of a crop is not assured till the peaches are as large as half-grown walnuts. If we were to wait till then, the branches would have a new growth of a foot or more. It would hardly pay to lose all of that growth. However, late pruning may be worked advantageously to a certain extent by leaving the greater part of the small lateral branches at the time heavy winter pruning is done and cutting them off with the hand pruners at the time of thinning the fruit. This plan will enable the grower to regulate the size of his crop to a limited extent. If the laterals are left full length till thinning time, then short pruning in case of a heavy set and long pruning in case of a light set will regulate the crop to a certain extent.

Experience has shown that peaches may grow in groups or bunches and still grow large if the proper amount is left on the tree to mature, and it is not necessary to have the fruit at, or nearly regular distances. If a cluster of peaches contains three large fruits, at the time of thinning, they will make just as large fruit as though they were evenly distributed along the branch.

PEANUT CULTURE.

Editor Cultivator: Will you please advise me through the Cultivator, all about growing peanuts in the San Joaquin valley? The soil here is generally of a sandy nature. What kind of seed should I use and where can the seed be secured?—W. A. M., Tulare.

The best qualtiy of nuts is raised on dry saudy upland. Peauuts grown on damp land, have a yellowish color and the quality is not so good. The land should be well pulverized on the surface so that the peanut viues will lie close to the ground and uot be propped up on clods. It is also essential to have the surface free from clods in order that the embryo nuts may easily enter the ground. They should never be irrigated if grown ou land that will bake and it is not safe to irrigate on any kind of land as it is liable to discolor the nuts.

There is uo stated time at which peanuts should be planted as this varies according to the season. The seed should not be planted until the soil has warmed up in the spring for good. This occurs some time in May. If the planting is done before this condition comes about, the nuts will make uneven grades and besides the early matured nuts will not lift from the ground at harvest time as the stems get soft and break.

The variety most largely grown in California is the White Virginia or Virginia Runner and commonly known as the California peanut. It is the kind commonly seen on the market and is the typical American peanut.

The White Tennesseee resembles it. The Red Tennessee makes a less spreading growth and less 'pops' or empty pods than the two varieties mentioned above. The North Carolina nut has smaller pods than the above named kinds and contains more oil than any other peanut grown, weighing about six pounds more per bushel than other varieties. A bushel of good peanuts should weigh about 22 pounds.

The Spanish peanut grows more erect than the other varieties and forms the nut near the crown of the plants. This nut matures quicker than any other variety and produces well if planted close, the rows three feet apart and a foot apart in the rows. This is the variety most used by confectioners, the small round kernels being about the right size to mix in peanut candy.

The California peanut is the one to plant as it yields three or four times as much as the other varieties and finds more ready sale.

Peanuts should be cultivated about the same as corn, not allowing the weeds to grow among them, keeping the ground loose and mellow about them and when the spikes begin to form they should not be disturbed. If they are, it causes the nuts to blight or not fill out. The blooms do not require covering.

Peanuts should be harvested when ripe. If allowed to stand too long many over-ripe nuts are left in the ground and if the little ones are allowed to ripen they lower the grade and thus there is a loss at both ends.

Peanuts should be plowed out and thrown into windrows, nuts down and left lie for about a week or ten days. When dry they should be sacked, as the best nuts are cured in this way. They should never be allowed to get wet. The tops make good feed and are worth storing away for winter use. All kinds of stock like them and chickens do well on the small nuts. An average yield is about twenty-five sacks per acre, forty pounds per sack. With extra care and good soil, fifty sacks have been grown.

It takes about thirty pounds of the California nuts to plant an acre and fifty of Tennessee Red. The former variety should be planted in rows about three or four feet apart and sixteen or twenty inches apart in the row.

Seed may be had from any seed dealer.

HARDPAN.

(Continued from First Page.)

protected from the effect of the sun. The hardpan at other places is more or less corrugated, folded, and lapped, giving every evidence of an upheaving force in operation at the present time. The existence of alkali in the ground and its disposition to swell or effervesce when moistened, is the true cause of the upheaval of the hog wallow. It is probably accelerated by the fermentation of decaying vegetable matter on the surface, which is carried down with the rain water. I was informed by a man living near there, that on Antelope creek, this county, he had seen a piece of ground three rods long and one rod wide raised six inches in one day and night, during the first storm of the season.

The freed alkali must have more room as soon as it becomes hydrous, and other minerals increase in bulk also as the silicates change to the oxyds and the oxyds from the anhydrous to the hydrous state. This condition of constant change produces the force that leaves the cracks and furrows in the hardpan. The perpendicular cracks become permanent vents for the passage of the soil from below. The soil in these vents or craters is always soft, light and porous showing the result of its continual motion upward in wet weather and downward move in dry, but always more up than down, always wearing away most the north side of the crater where the material is softest, always forced from below by the same cause, the hydration of the alkalies.

It has been suggested that gypsum would have a tendency to soften hardpan, but I can not find any good reason for that belief.

The base of carbonate of lime and gypsum is the same, calcium or lime. The former, lime 57; carbonic acid, 43; the latter lime, 40; sulphuric acid, 60, and except in connection with some other property this proportion varies very little and in that case sulphate of lime could have little or no effect on carbonate of lime, which is the principal property of hardpan.

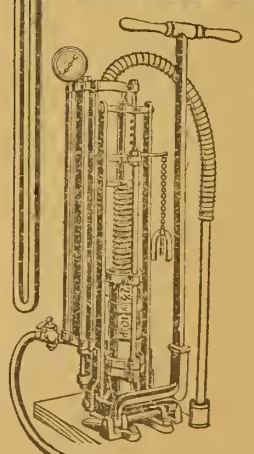
Some time ago, I wrote an article on mineral oils, it was published at the time in the Tulare Times, and in that article I think I made it appear quite reasonable that a change of lime from the carbonate to the sulphate would liberate all of the chemical properties necessary for the formation of petroleum oil and illuminating gas, and that by the agency of sulphuric acid.

Now from the strong affinity of lime for sulphuric acid it would be quite reasonable to try the effect of sulphur on hardpan; the effect would probably be to change the carbonate of lime to gypsum, thereby liberating carbonic acid and hydrogen gas. This would render the hardpan soft and porous.

Less Work—Better Results

The first matter of importance when spraying is to secure clean fruit and healthy trees; the next thing is to have expended the least possible amount of time and money.

Bean Magic Spray Pumps



are peculiarly adapted to do these things. They are entirely different from other pumps in almost every respect, but particularly because they

Save One-third The Labor

In the Spring rests the secret. What's the use in working so hard when the same results can be accomplished with a third less labor? Save time and effort by dividing the work, doing half at each stroke of the handle instead of doing all at one stroke, and meanwhile be working against only **one-half** the pressure indicated on the gauge. **Magic** pumps are built in two sizes and have non-clogging ball valves. It is worth your while to see one in operation.

Write for our special offer, freight prepaid, and we will also send our illustrated catalogue No. 16 describing all ten sizes of hand pumps and telling what sprays to use and how to prepare them. State number of acres and kind of fruit. Write today. (Catalogue No. 18 describes Power Sprayers.)

CITRUS FRUITS

By C. A. Day. Pasadena

ORCHARD CONDITIONS.

Our late rains are timely, saving to the orchardist further expense of irrigation. There is but little evaporation at this time of the year and a little moisture will go a long ways. In many cases the orchardist has continued irrigation up to the time of the first rain. This is always a safe plan as in many instances citrus trees are allowed to suffer from a lack of irrigation in waiting for the first rains that are often long deferred.

* * *

The Present Condition of the Orange Crop is fairly satisfactory. With the liberal rainfall of last winter and the early rains of this fall there should not be very much puffy fruit. In orchards that have received good care the fruit is well sized up.

Some weeks ago, the show for holiday fruit was very poor, but in the last two or three weeks the oranges have been rapidly coloring and there is now every evidence to indicate a good supply of oranges for the holiday trade.

There is in some localities an unusual amount of split oranges and the old question is again asked, what causes oranges to split and what is the remedy. Theories are advanced as to cause, but they are only theories. In ordinary years the loss from split is small. In some orchards there is some dropping of fruit, but it is notaing very serious. In some cases there is evidence of red spider. At this time of the year the red spiders are frequently congregated on the fruit. Examination shows but few eggs since the rains and as long as this condition lasts we need not look for serious injury from them. If the orchardist will keep a close watch on the egg production of the red spider he may determine very closely as to future increase of the pest. As to whether the spiders are responsible for the dropping of the oranges, it would be hard to say, as the dropping has been as bad in orchards sprayed, as in those not sprayed.

* * *

Scutellista.—In orange orchards under a high state of cultivation there is some of the early hatch of the black scale that are now in the egg stage. Very frequently these scale are of small size, though fully developed. It is a matter of encouragement to note that a good per cent of this scale is attacked by the scutellista, although the work of the parasite is not as thorough and complete as in the months of August and September. Occasionally I find the scutellista attacking the scale before it gets into the egg stage, but it is rather an exception than a rule. It is encouraging to note the parasitizing of this late irregular hatch or scale, as otherwise there would be a considerable amount of young scale hatch out during the fore part of the winter, and, this would make future treatment of the scale difficult. Where the black scale all hatches out in mid-summer and early fall a single treatment is effectual, but with the scale in all stages of development the treatment is effectual only on the young scale and the orchard carries a stock of scale throughout the entire year. For this reason the scutellista is a great help in destroying a considerable portion of the late scale in the fall and fore part of winter. The pepper trees in and around Pasadena are now freer from black scale than for years, probably due in a large part, to the work of the parasite.

We are in hopes that an increased dosage of cyanide, made possible by an increase in the amount of water used, will enable fumigation to destroy the black scale in the advanced stages of development, if this should prove true, a single treatment by fumigation will be more effectual, even though a part of the scale are in an advanced stage.

* * *

Storm Water.—With the beginning of the rainy season steps should be taken to care for the storm water, and the measures taken should be ample to care for the maximum amount of rain fall that is possible in the case of heavy storms. First of all the soil of the orchard should be put in condition to absorb as much as possible of the rainfall and angling furrows should be struck to carry off the surplus without cutting and washing of the soil of the orchard. Very frequently a sag in the surface of the orchard will bring on accumulation of water that will cause severe cutting or channelling of the surface. Angling furrows will, in this case, take care of the surface water and prevent the cutting of gulleys. Of course the prime object is to put the soil in condition to absorb all the rainfall possible. but with bad treating and long continued rains the surface becomes parched and there will be a rapid run-off of the surplus water and the safest course is to provide for such an emergency. On heavy soils it is not a good policy to keep the surface too smooth and even during the rainy season. A cover crop is beneficial in checking a too rapid run-off of the rainfall and will aid in the preventing of severe washing.

THE THIRTY-FIRST FRUIT GROWERS' CONVENTION.

The next annual Fruit Growers' Convention, the Thirty-First, is announced to be held at Santa Rosa, opening on Tuesday morning, December 5th. From the names appearing on the programme it will be seen that the various topics of interest to fruit growers will be handled by some of the best talent in the State. The speakers include Governor Pardee, Prof. David Starr Jordan, Prof. Benjamin Ide Wheeler, Luther Burbank, Lieut. Governor Alden Anderson, J. A. Filcher and many others who are well known to all the people of the State. Two very important features will be an illustrated lecture on the weather and crops, by Prof. Alexander McAdie, Director of the Weather Bureau, and another by Prof. M. B. Waite, the pear blight expert, from Washington, also illustrated. The people of Santa Rosa are making every effort to make the visitors feel that they are welcome, and have arranged a reception and electric rides, besides trips in automobiles and carriages. The hotels have made special rates and the railroads will issue excursion tickets, enabling visitors from all parts of the State to attend at reduced rates.

By Dec. 1 the Los Angeles office of the Cultivator will be moved to 115 No. Broadway, (up stairs).

STABLE MANURES.

Except through the growing season or just previous to it, manure may be put upon the land straight from the cowshed or stable. During the growing season such dressing should be leached. For this, place a barrel or box upon a slightly tilting board, having grooves to drain from gimlet holes near the bottom of the receptacle to a bucket or barrel. For small quantities a leaky pail or wash boiler, or the like could be used instead of the barrel. Place in the receptacle a layer of broken crockery, shells or other organic matter, and upon this a six-inch layer of straw, hay or weeds and on this the manure. Pour water or house slop on the manure until the leach scarcely shows color then empty the receptacle or fork out what remains of the manure and use as a mulch. Or keep adding fresh stock to the barrel until it is filled, then in the autumn put the residue on the land. An occasional layer of wood ashes will give a welcome addition of potash. Dilute the drip according to its strength and apply to the ground about the plants.

The best time for the application is after a rain or during a light rainfall, the rootlets then being in the best condition to assimilate it and the ground to receive it. For salads, beets, turnips, rhubarb, cabbage or other varieties where leaf or root is desirable, add a spoonful of nitrate of soda to the bucketful of the drip. For beans, peas, corn, or seed production a handful of bone meal will help. For tomatoes, give both. The liquid will be taken up at once by the feeding roots, and very soon show in the plant growth. Best results are obtained from night soil and poultry droppings by the same treatment. Never use fresh manure as such in the garden, unless bacterial disorders of the plants are desired and weed seeds are wanted.

VALENCIA LATE

And all the leading varieties of Orange, Lemon and Marsh's Seedless Grape Fruit Trees for sale. Are principally two years from bud and very fine. Can furnish from my nurseries at Glendora, Riverside or Redlands, as desired. Address

FLORICULTURE AND GARDENING

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

SHRUB PRUNING.

Shrubs such as spireas, deutzias, Philadelphus, weigelia, etc., should not be pruned at this season of the year. It is a mistake made by a great many and should be remedied. When they flower in the spring, it is along the full extent of the branches, and if pruned at this season it takes away the graceful effect that is so essential to their beauty. The proper time to prune them is immediately after flowering which gives them a chance to make a good growth of flowering wood for another season.

A PRETTY SUCCULENT.

Rochea falcata is a native of Southern Africa, belonging to the order Crassulacea. The grayish leaves, together with the bright scarlet of its large panicle of flowers, makes it a very attractive plant, blooming as it does throughout the whole summer.

Take off a thick leaf, place it in sand, and you will soon notice that a small eye has formed, that ere long you will develop into a branch, and thus you gain a new plant.

PLANT LICE.

Fifty-eight persons competed to get the prize offered at Frankfort, Germany, for the best method of destroying plant lice. The winner's preparation is as follows: Quassia wood, two and one-half pounds, to be soaked overnight in ten quarts of water and well boiled, then strained through a cloth and placed, with 100 quarts of water ,in a petroleum barrel with five pounds of soft soap.

DAHLIA ROOTS.

Dahlia bulbs (so-called) will soon have to be taken up and stored away for next season. In this climate, it is not absolutely necessary, but is much better than to leave them in the ground, as they take up room that can be utilized for other flowers during the winter season. When taking them up cut the stalks down to within one foot of the ground and store away in some dry sand in the cellar or other dry place. It will be a step in the right direction to label them as to color and height, providing you have not the names of the different varieties, as they can then be planted next season with a better idea of harmonizing their colors and growth.

GRAFTING CACTI.

The best time for grafting Cacti is during the growing season. Epiphyllums are often grafted on Pereskia, but Cereus colubrinus is no doubt much better for the purpose, and C. grandiflorus and all that class are equally good. One of the most successful grafters of the Cacti we have in the West, uses C. grandiflorus entirely

when grafting cions of Epiphyllums and Cereus flagelliformis cristata.

The operation is an easy one. Cut a V shaped notch in the stock or split the stock and insert the wedge-shaped cion. Sometimes both are necessary, according to the size cion. Having fitted the parts as well as possible, run a sharp spine through both stock and cion and bind securely in place with twine or raffia, and nature will do the rest.

Some curious plants may be obtained in this way, particularly when Echinocacti or Mammillarias are grafted on the slender-growing Cere.

In arranging your garden, try to have it so there will be a succession of bloom.

NEEDS OF VILLAGE IMPROVEMENT ASSOCIATIONS.

1. Funds to considerable amount to serve as a nucleus for investment as well as for immediate use, should be secured before starting work.

2. Annual subscriptions should be obtained and when practicable pledged for some years ahead, to insure the permanence of the organization and the continuance of its work.

3. Endeavors should be made to interest all classes. Children might be permitted to set trees themselves under the direction of the association.

4. It is well to begin operations at some point in which the whole community is interested, such as the cemetery, or the public green or square. Avoid attempting to do too much at once.

5. To keep up the public interest in the association and to look after its work, it is important to have monthly meetings of the executive committee.

A HONEY-BEARING EUCALYPT.

Mr. James Brogan, of Attunga, Australia, in a plea for the preservation of "Yellow-box" (Eucalyptus melliodora) from the ringbarker, draws attention to especial value of this variety of timber tree for honey production. From his experience, the honey harvested by bees from any given area of "Yellow-box" is of greater monetary value than the wool that could be raised from the grass on the same area. There are 70 acres of this variety of tree on his own place, and in some seasons he has obtained more value in honey than if the area had been cropped with good wheat at a fair price.

As a useful timber "Yellow-box" lasts in the ground twice as long as ordinary box, and should be very valuable for mining purposes, as nearly every tree about would make lengths suitable for mining requirements.

HARDY ANNUALS.

Hardy annuals can be sown at any time and it will be a good plan to ask the seedsman when buying, as to the best varieties to sow at present. Sweet peas should be sown during the winter months, as they bloom much better and with larger flowers and better foliage, than if sown too late. Why not try some of the dwarf "Cupid" sweet peas, they can be brought in several colors and are very satisfactory.

If there is a low and unhealthy place upon your grounds, plant liberally of nasturtiums and sun flowers. It may save you a doctor's bill.

Do not plant begonias in a saturated soil, hot sunshine, or an arid atmosphere. Plant them where they will be sheltered from the wind, and also the sun during the hottest part of the day.

SECTION OF YEAR-OLD PLANT PHOTOGRAPHED IN THE FIELD

Buy Burbank's Rhubarb

This creation of California's plant wizard is practical for you in your garden. It's ever-bearing—(Winter, Summer, Fall and Spring.) Crimson flesh. Never stringy. Stalks small but juicy. Tender and luscious as a berry. Needs little sugar. Everything you've wanted rhubarb to be.

Roots **Northern Grown & Robust.** Three year's successful bearing in our trial grounds. Require but little water. Plant now and cut this season.

How to Cook the Rhubarb.—Since the Winter Crimson requires much less sugar than the ordinary varieties, a few suggestions as to how to cook it may be found useful. The color of the rhubarb before cooking is of a greenish crimson which, when cooked, turns into a rich, clear shade of crimson. Bake slowly in earthen dish, sprinkle lightly with sugar and just cover with water. For making jelly and preserves it is excellent, and its medicinal properties are fine.

Price prepaid, small roots 25c each, $2.50 dozen; larger roots 50c each, $5.00 dozen.

In the Vegetable Garden

MILDEW OR BLIGHT OF POTATOES.

In 1902 the Connecticult Experimental Station began a series of spraying experiments with potatoes to determine the amount of injury due to Phytophthora infestans, and, secondly, to determine the most effective and practical method of spraying to prevent it. In this report is presented the results and suggestions based upon the experiments thus far carried out.

While the blight fungus is one of the most serious pests of the potato in Connecticut, the author states that frequently injuries caused by other organisms are attributed to it. The results obtained in spraying with Bordeaux mixture vary with different seasons, but depend largely on the thoroughness of the treatment and their applications at the proper time. Increased yields due to spraying, varying from almost nothing to over 100 per cent., are noted; to be economically profitable the author says that an average gain of 15 to 20 per cent. should be obtained.

Where late potatoes are sprayed for the blight the author advocates 2 to 4 thorough applications of Bordeaux mixture, the first to be made between July 5 and 15 and the last about the end of August or first of September.

IRRIGATION FOR ONIONS.

Mr. Frank Bond, of the Irrigation Investigations Division of the United States Department of Agriculture, in discussing the crops in ordinary districts that can be greatly benefitted by small and inexpensive systems of irrigation, instances the case of onions grown in the South of Georgia. In that district, when there are opportune rains in May and June to mature the crop, the average yield is about 800 bushels of onions per acre, worth one dollar a bushel. During May and June of the years 1901 and 1902 the necessary rains did not come, and complete loss of crop followed, the plants withering away in the dry and shrivelling heat. In the opinion of Mr. Bond, one good irrigation each year would have saved the crop and made the returns maximum in quantity and irreproachable in quality—measured from an onion standpoint.

MUSHROOM GROWING FOR AMATEURS.

Experiments were undertaken at Cornell University, in the culture of mushrooms to learn what success might be expected by amateur growers where no elaborate preparations were made as to special houses.

Cellars or basement rooms may be used for mushroom culture in winter provided the temperature does not go below 55 degrees F. They should not be grown in cellars under the living part of a house, as the fumes of manure will fill the house. They can be grown in stables which are not too cold.

In the station experiments they were grown in part in boxes under benches in the greenhouse where the temperature during the winter was about 55 degrees F. at night and 60 to 65 degrees F. during the day, and in part under a bench in a basement. The boxes used were 3x3.5 feet wide and 1 foot deep. The bed under the bench in the basement was made by placing a plank against the legs of the bench and filling the space between that and the wall with well-packed manure. The boxes and bed together contained about 90 square feet of surface and yielded at the rate of about 2 pounds of mushrooms per square foot. The manure for boxes and bed was composted October 31 and was ready for putting in the beds November 9.

The beds were spawned November 23 and covered over with dirt December 1 and 2. The first mushrooms were picked January 1, or about 5 weeks from the time the beds were spawned. The regular picking began a week later. The spawn in a small part of the bed did not produce mushrooms until about 2 months after spawning. When the crop was at its best 4 to 8 pounds of mushrooms were collected at each picking.

Detailed directions are given for the making of mushrooom beds in cellars, for the preparation of the manure and packing into the beds, and for the buying and insertion of the spawn in the prepared beds, with general notes on the growth of mushrooms, picking mushrooms, and the enemies affecting mushrooms. Illustrations are given of the varieties Alaska, Columbia, and Bohemia, as grown under the different conditions in the experiment.

VALUE OF BEAN STRAW.

Bean straw, the lowly empty pod of the lima, and the vine, despised and abused and csnsidered in the way for years, has come into a prominence of its own, and it is now no small part of the bean crop. This year the limas produced also a ton to the acre of bean straw. This is baled and cared for now as something of value. It has grown to be so much appreciated that it brings $5 the ton on the ranch to the farmers. And there is ready sale for all the bean straw raised and more is wanted. Clear bean straw makes the best possible feed for milch cattle. Mixed with beet pulp it is the finest of fatteners for stock cattle, and taken all in all, nothing can equal it for all-round stock feed. Horses relish it and will not starve to death upon it, as was once thought they might.

There will be sale for every ton of bean straw grown this year and much more would find takers before the next bean season comes around. Bean straw makes rich milk and plenty of it and this means good butter. From getting to be something in the way and only fit for burning or putting on the roads, bean straw has grown to be an actual necessity to the farmers.

There are few joys that are sweeter, and no service that is more beautiful, than to forgive those who have offended.

LADY THOMPSON AND EXCELSIOR STRAWBERRY PLANTS
For Sale, or will exchange for Brandywines, Glen Marys, William Belts.

Educated Citizenship.—Vice President Fairbanks repeated the lesson of the Golden Rule in his address at Indianapolis on Sunday last, where in he declared with great earnestness that "Our safety lies in an educated citizenship. The best interests of labor are to be conserved through the instrumentality of the schoolhouse. There is no better code by which to live than the Golden Rule. It has been the guide of millions in ages past, and it will continue to guide the conduct of millions yet to be.

"If you can do no kindly act to your brother, act not at all. I am a firm believer that as a people we are growing in greatness and expanding in all the ways that make for better men and better women, for better homes, for a better city, a better state and a better country."

These are inspiring sentiments to fall from the lips of the second citizen of the Republic. In these days of graft and treachery in high places the country will do well to give heed to the injunction proclaimed in the doctrine set forth in the Golden Rule.

* * *

Thanksgiving Proclamation.—The President's proclamation setting apart November 30 as a day of thanksgiving is something quite aside from the usual run of these documents. Not only does the President abandon the customary phraseology, but he goes back of the form to revive the original meaning and purpose of the day. Just as after his critics had all agreed that he was dangerously devoted to bloodshed and in love with war he appeared as an international peacemaker, so now after being long pictured as a lover of vainglory he earnestly reminds the people that they are called not only to thankfulness, but to an acknowledgment of shortcomings.

"We live in easier and more plentiful times than our forefathers," the proclamation declares "and yet the dangers of our national life are quite as great now as at any previous time in our history. It is eminently fitting that once a year our people should set aside a day for praise and thanksgiving—manfully acknowledge their shortcomings and pledge themselves solemnly and in good faith to strive to overcome them."

This is certainly most wholesome doctrine, but it would puzzle the most serene and contemplative to find anything of the swaskbuckler in it. The man who wrote that certainly did not lean back to stretch his legs complacently and pat his thigh. That utterance does not smack of after-dinner materialism in the slightest degree.

But perhaps thoroughly vigilant critics may find in the proclamation some evidence of the militant spirit they are ever ready to deplore. There is, indeed, an allusion to war and struggle and enemies to overcome. "The foes from whom we should pray to be delivered are our own passions, appetites and follies; and against these there is always need that we should war."

President Roosevelt is indeed what the Germans call a many-sided man. The Thanksgiving proclamation reveals one of the least suspected but most admirable and worthy.

The President is a man for peace as well as war—for the day of thanksgiving and humility as well of victory.

* * *

The Joy of Thankfulness.—Out here in California, where the glad sunshine and the glorious rains conspire to make nature one long, sweet day of thankfulness, we ought to rejoice that we live to witness the fact that there is sunshine in the world and that it is for us if we accept it, and for our happiness if we will it. In spite of all the grumbling of the pessimists, the disappointed, the nature born weaklings, it is usually good to live. It is a glorious thing to be here, and to be a part of the grand economy of the universe where, as we may realize, if we will, the joy of being thankful for blessings showered on us.

There is joy in being thankful. The soul which can attune itself to the harmony of blessings, carries with it the highest condition of human happiness. The soul with face ever turned toward the light of God's eternal love is full of thanksgiving and rejoicing. It comes to see the beauty and gladness of the world.

If we could bring ourselves to realize that heaven is here just as much as it is anywhere, that by duty well done, always faithfully performed, we open the door to the highest pleasure it is possible to attain here or hereafter, life would be one continued song, for work would be but recreation and the temporal things of this world merely a pastime for our energies. For, after all, we are but embodied spirits, with just as much power to do good, to be good and to be happy, as we ever shall be—even after we lay down the mortal body and become immortal.

I know a dear old lady 75 years young, yes, young, who in the last 25 years of her life lived in continued rapport with the good and the beautiful. Whose face was ever turned toward the sunlight of truth, who saw beauty in everything, and opportunity to bless her fellow beings, in smile, in word, indeed wherever she went. Every flower to her was a poem. Every star an emanation of divine love. Every sun-kissed dew drop a benediction from her heavenly father in whose radience she basked and grew younger as the years sped by. She seemed always to carry with her the remembrance that out of the loving cup of God's abundant graces there was enough for her—for all. She knew that it was better to love than to preach; better to lead people into the true way than to drive them; better to sympathize than to complain. Sadness found no receptacle in her soul, and the magnetism of her smile held old and young her willing auditors—because it was the smile of love.

I stood by her casket, the same glad smile as in olden days lingered around her lips. The same kind expression wreathed her face as of yore, and there was in the close of her mortal career something which seemed to say, "I am at home in my father's care." Her's was the true understanding of life, the gladdest life in the world. Her's was the realization of a soul that had gained joy and knowledge by living near to the infinite heart of the great teacher.

So may we all live, if we will, so may we all pass away, with our eyes filled with light and our face covered with smiles, because of the absolute confidence that the life we lay down here is but the beginning of that other one—the one replete with eternal energy.

So on Thanksgiving day let us be happy. Glad for the blessings which the year has brought us; glad that we live, and with Ruth Raymund say:

Accept our thanks, O Father, Lord,
For all the harvest riches stored,
For raiment fair, for frugal food,
For pleasant homes and all that's good.
And Father, God, accept, we pray
Upon this glad Thanksgiving day,
Our thanks for friends who loved us more
This passing year than ere before:
Who proved their love when troubles came,
And joy for use seemed but a name.
With words of cheer and timely aid
They bade us "rise, be not afraid."
So on this festal day of Thine
We thank Thee, Lord, for love divine.

By Dec. 1 the Los Angeles office of the Cultivator will be moved to 115 No. Broadway, (up stairs).

They Will Not Learn.—It seems as if the Russion people will never learn the value of experience. They are as blind today to the lessons of the past as they appear to be of the fate in store for them in the future.

There is no well defined patriotic sentiment among the people. There is a determined effort to crush the autocracy, but between the various factions which exist there is no concert of action. The various groups into which the liberals are splitting and even those who advocate the very constitutionalism into which Count Witte is seeking to conduct the government, seemingly would rather let the country drift into anarchy, than turn to the support of the only man who has the good of the country at heart. This perhaps is not strange, considering that all the intelligent classes are engaged in a revolt against the old order of things, the Moderates for the moment clasping hands with the ultra-revolutionists to accomplish the downfall of the autocracy. The result is that all the reform elements are distrustful of the government, and take pride in holding aloof as if everybody connected with the government was contaminated, and there is no solid Conservative element to use as a brake upon those who shrink from no political experiments, no matter how reckless.

The situation may be summed up in this sentence: Russia is determined to pay the heaviest price possible for every step of progress she takes.

* * *

Those Wall Street Gamblers.—Secretary Shaw's refusal to come to the relief of Wall Street operators, last week, has opened their eyes to the fact that they cannot use the Secretary of the Treasury to liquidate their plunging deals.

In this decision Mr. Shaw was supported by the banking element of Wall street. To several bankers with whom he conversed the Secretary of the Treasury emphatically expressed the opinion that the situation did not call for any measures of redress. To those with whom he discussed the situation personally he said that there was ample money for the business and commercial world, and those who needed money had no difficulty in obtaining it.

The merchants and manufacturing classes and others who are engaged in trade, he argued, found little difficulty in having their bills discounted at the banks here and in other centers of population. With those who needed funds for speculative purposes in the stock market, Shaw expressed little sympathy. He said that warning had been given in ample time, and that the stringency which now prevailed was directly traceable to the operations of Wall Street cliques who had borrowed money for speculative purposes.

* * *

Bankers who discussed the situation with the Secretary stated that his views of the money market and his plans were summed up in the following allegorical statement: "If I see boys playing with matches and they burn themselves, I can merely look on and hope that a salutory lesson has been taught them. If, however, the boys in playing with matches start a fire which threatens the house and its contents, I will do all in my power to put the fire out, before serious damage is done."

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

It is now past the middle of November, and still Gilroy growers are making almost daily shipments of strawberries, large in size and fine in flavor.

The apple crop of Pajaro valley is a heavy one this year, but prices are low. Rushing too much green fruit on the market early in the season is the reason assigned for low prices.

The Crafton Orange Growers' Association has been organized and is ready for business. The packing house is almost completed. Its brand will be Crafton for fancy, and Mill Creek for choice.

There is a great future for the wine grape, as well as for the Tokay variety, in the foothill districts of Placer county, according to a statment made yesterday by Prof. H. S. Hussman of Washington.

Many tons of good apples will leave the orchards of upper Tule this month, and many more would leave if a remedy could be found for codling moths. Fully half the apples are ruined by moths.

The Whittier Citrus Association shipped its first carload of navel oranges last week, ten days later than the first shipment last year, but the fruit is nicely colored and is considered to be superior to any other first shipment for a number of years.

Grapes continue to sell well in the Eastern markets. A carload in Chicago yesterday fetched $1267; Pittsburg, $1260; Philadelphia $1472; New York, $1876. There is a steady demand for Emperors, but Tokays and Cornichons still hold their own in the prices.

For the week ending November 11, six carloads of tomatoes, onions, peas and beans were shipped from Whittier to Los Angeles over the line of the Pacific Electric Railway alone, in addition to 2000 crates of tomatoes which were billed directly to Eastern markets.

New York, Boston and Chicago continue to ask for carloads of California grapes. Other cities would welcome shipments, but the supply appears to be limited, the clean-up of the product of the entire crop being complete, thanks to the excellent fruit gathering weather that has prevailed this autumn.

The raisin crop of 1905 in the El Cajon district is about all packed and is probably the smallest in the history of the industry. The amount packed by the El Cajon Raisin Company, which handles practically all the output, was only about 200 tons, as against an average for other years of 1000 tons.

The California Vegetable Union which has been buying the La Habra and East Whittier output of tomatoes, has raised its purchasing price from $30 to $40 a ton. The crop still holds out well and the increase will mean thousands of dollars to the growers. It is estimated that there will be a total crop of 1500 tons this year.

George C. Hussman, pomologist in charge of viticultural investigations of the Department of Agriculture, and G. H. Hecke, expert in viticulture, Department of Agriculture, were in Sacramento yesterday and went to Auburn on an evening train in connection with the experimental vineyard which it is proposed to locate in the foothills near that city. In case a tract is secured that is entirely satisfactory and the owner undertakes to carry out the requirements of the department the station wil be established at an early date.

A representative of the Cultivator recently making the rounds of our best southern orange growing districts, found that is some sections of Riverside and San Bernardino counties, split oranges are very common. A grower from near Highland writes to say that his loss from splits will run to five per cent. of the crop. In that district the trouble is generally attributed to drying winds which somewhat seal the rind and then the subsequent development of the fruit causes the rind to split by reason of the interior pressure.

C. A. Harwood, a prominent rancher of Long Valley, Nev., has perfected a hybrid melon which is pronounced by the agricultural department of the university to be a cross between a watermelon and a muskmelon, having the rind of the former and the seeds of the latter. The peculiar property of the fruit is that it will keep from one season to another remaining perfectly sound and maintaining its flavor as well as apples. The fruit grows to an immense size, some of the specimens weighing as much as thirty pounds.

Orange picking and packing has begun in the Redlands district. Some growers seem to possess a desire to get their fruit on the market early, whether its condition will warrant it or not. The fruit being picked is not an early variety, but the regular navel orange. The greater part of the fruit scarcely shows a tinge of color, and is practically devoid of juice. Letters from eastern houses asking for early shipments express their dissatisfaction at receiving oranges which have been "doctored" to give the deep yellow color, to say nothing of flavor or sweetness. This "doctoring" is said to be going on in Redlands; some of the first oranges gathered, being steamed to give the deep color before shipment.

AGRICULTURE.

The bean crop of the Goleta district is estimated between 8000 and 10,000 sacks.

The California Vegetable Union began shipping cabbage from El Monte last week.

The express shipments for the week from Escondido station were 900 dozen eggs, 500 pounds butter, 680 pounds cream, and 2107 pounds chickens.

J. W. Hall called a meeting of hop growers together in Supervisor's Hall in the Court House at Santa Rosa, and a temporary organization of the Sonoma County Hop Growers' Exchange was effected.

Up to last Saturday applications for 1906 beet contracts had reached the sugar company at Chino, covering a total of over 6000 acres. Manager Schroeder says that no effort has been made this year to get the applications in early, and that a large acreage is in sight.

An inexpensive plan of beautifying the hills is to be put into practice on the hills surrounding Whittier. Every one who goes for a stroll on the hills is to scatter poppy seeds. This will soon give Whittier poppy fields which, from their location on the hillside will rival those of the valley.

The hop growers of Sonoma county held a meeting at Santa Rosa Saturday and took steps toward organizing a hop growers association to be known as the Sonoma County Hop Growers' Exchange. The object and purpose of the growers is to cut out the middle men and thus get the full market price for their products.

Manager J. A. Driffill of the Oxnard factory informs the beet growers that the new schedule of prices for the 1906 crop of beets is proving very satisfactory to the farmers of the valley and that new contracts are being signed up rapidly and that present indications point to a very large acreage of beets for next summer's campaign.

An immense sugar plant will be erected within a short time for the Pacific Beet Sugar Company, says J. G. Hamilton, of the American Beet Sugar Co. The location of the new plant is to be at Chico, in the northern part of the State, and it is possible that a second one may be erected in the San Joaquin valley.

A large wheat grower of Washington claims a combine of the Washington millers and the exporters of the northwest to hold down wheat prices. He urged the farmers to pool their interests and offer their heavy wheat to the San Francisco buyers in cargo lots, thus securing better prices and defeating the alleged agreement in Washington.

Besides being a prolific season for the bean ranchers, the past year has been a peculiar one. Not only was the crop of limas a record one, but the price has been good and firm and constantly on the rise. The estimated yield has been more than 650,000 sacks. The greatest yield in any previous year was, in round numbers, a half million bags.

Conrad Graf of Banning, stated to us recently that there were raised between Banning and Beaumont the past season 65,000 sacks of grain and that the season was a very prosperous one in fruit and agricultural lines. From two acres of almonds that were set out in 1891, he sold $480 worth of nuts. From five acres of French prunes, seven-year-old trees, he received $915. He further informed us that a company was being formed to take over the water system at that place with the intention of developing the supply to its fullest extent and placing under irrigation several thousand acres of ground in that valley.

Notice has been posted in the local United States Commissioner's office at Covelo, that the relinquishment portion of the Round valley Indian reservation will be opened to settlement January 15, 1906. There are 66,000 acres in this tract and it is mostly grazing land, but has some very choice timber. Settlers who were living on the land January, 1904, will have priority right in filing. In addition to the above what is known as the Buck Mountain survey comprising about fifteen thousand acres, will be put on the market about March 1. W. J. Lightfoot, a special examiner from the Interior Department, has just approved this action.

LIVE STOCK.

There are 2000 poultry yards and 600 dairies in Los Angeles county.

Don't feed smutty fodder. It will have a bad effect upon the ewes, as well as greatly reduce the per cent of strong healthy lambs.

Dressed turkeys are being shipped by carloads from the Waco, Texas, to California Prices have advanced there to 11 and 12 cents per pound.

A firm from Carlsbad, San Diego county, have been traveling through the Westminster county to contract for the purchase of 300 cases of eggs —10,000 in all. They say they will hatch this number in a monster incubator.

Texas is now shipping turkeys in carload lots to California. That is one of the commodities that California farmers should not allow to be shipped in. There is money in turkey raising, and California farmers ought to have it

The Santa Clara Valley Poultry Association held an important meeting last week in the Chamber of Commerce. The meeting was held for the purpose of re-organization and to stimulate an interest among poultry raisers of that county.

The Chino Land and Water Co. now has about 2400 head of cattle on the ranch, with more coming. The 1325 head received last week from Utah were shipped over the Salt Lake road, and were the first through shipment of cattle over the road. The service was excellent, as high as 60 miles per hour being made by the train.

Wm. Bewg of Lompoc was in our office one day this week looking for addresses of breeders of Poland China hogs, as he wanted to buy some good stock. Mr. Bewg stated that his ranch had recently sent eight cars of fat short horn steers to Los Angeles, receiving 3 1-4 cents per pound for them. This price was much lower than he received a year ago. He stated that his company will go into sheep heavier in the future, that the demand for mutton is greater than the supply and the price of wool being 15 cents made sheep raising an attractive proposition.

MISCELLANEOUS.

Pasadena is preparing for its annual rose carnival on January 1.

A tan bark oak near Willitts recently cut, made seven cords of wood, and was eight feet in diameter of trunk.

LINERS

FRUIT GROWERS, ATTENTION.—USE Griffith's Smudge Fuel. Don't let your fruit freeze when you can be protected by using Griffith's Smudge Fuel. Stoves, 50c each; 20 stoves per acre, stoves good for ten years. Fuel $8 per ton; 16 lbs. to the stove lasts four hours. Address, 1023 So. Broadway, Los Angeles.

C. H. SESSIONS, ASSOCIATE EDITOR

THE PRODUCT OF THE HERD.

In reply to the question as to product in cash of the old herd being over fifty dollars net for butter alone, Yes! that was correct. The herd consisted of cows of all ages but had been carefully worked up, with the Babcock test, and weeded out for two years, and was also being tested monthly during the entire seven years. Each cow was charged $6.00 a year for pasture and $1.00 for repairs on barns and fences. The barley, corn, silage and mill feeds were charged up to them, the wages of milkers, feeders, buttermaker, and the time of three horses and the men that sold the butter in town, as the engine pumps the water for the ranch houses and stables and flowers, the cows paid only half the expense of fuel and repairs in the engine house. The only item that might have been added was interest on money invested, that might have been charged to them. The butter sold for fifty cents per roll of one and three-quarter pounds. The best cow made from six hundred and twelve to six hundred and thirty-seven pounds yearly, twenty others averaged over five hundred pounds each. The best cows when fresh received heavy rations of 45 pounds of grain a day down to none as they ceased to pay for their feed. All the cows received at all times was alfalfa hay and silage of either corn or alfalfa. If the silage gave out and there were no pumpkins for succulency the cows fell off rapidly in milk.

In addition to the butter produced there was a valuable herd of calves that sold readily as yearlings at thirty dollars a head. The pigs also returned some cash, though during the year usually one a week is for butchering as well as one veal, for the men's table, the rest of the time beef was used, often one of the two-year-old steers raised at home. About six hundred dollars worth of pigs and hogs were turned off to the butcher, of course, these while receiving the skim milk, also received the cull fruit from the packing house as well as the raisin waste and olive pulp. The manure from the herd heavily covered 160 acres of the vineyards and orchards. Lest you think this can not be done with good cows in California by other people, I will tell you of one man, where I could fill the Cultivator with the accounts that I know to be true of like successes of many others. On the table under date of Nov. 13, 1905, is a letter that ends with these words: "Just got check for last month for cream from 25 cows of $176.32. Who says cows are not all right?" This is from a man who started with almost nothing, on rented land without proper improvements, and bought these same cows by note paying half the cream check each month on the note. He is now preparing to buy the land after paying for the cows and supporting his family during the time in comfort. In California if a man is willing to work and willing to be honest he has no difficulty in getting a start.

If my questioner is from the East, I would say the basis of this result is alfalfa, the best milk making food ever grown and when balanced with corn silage, the cheapest that can be fed to dairy stock.—Minna E. Sherman.

PAYING OFF A DEBT

To save moving in quest of a suitble location five years ago, we went into debt $3500 entirely for our farm of 70 acres as well as for nearly all the cows, horses, and farm implements with which to begin work and even for feed to carry our stock through the approaching winter. It was rather a large undertaking to face such a debt, says Mrs. Lamoni in Farm-Home.

We had a retail butter route all ready to step into, otherwise we would have scarcely made the venture.. We have really never suffered for want of financial aid, perhaps because we have made it our business to discharge our obligations at the time agreed on, and so kept our credit good.

We bought a sufficient number of Jersey cows to supply our trade, getting most of them from dairymen who were going out of business. We put in a cream separator and modern butter making appliances. Abortion got into the herd and caused much trouble, but keeping the cows clean and disinfecting the premises with lime and carbolic acid caused it to die out after some months.

We lost two cows from milk fever the first winter. They were allowed to get too fat before calving, but it taught us a lesson in the care of cows. Our cow barn is a very ordinary affair, but by the use of whitewash, cement gutters behind the cows and daily cleaning, we keep it in a fairly sanitary condition. With building paper along the inside walls and other aids we manage to keep the cows comfortable during the winter.

At the end of the first year we built a stave silo just outside the barn and the cows are now fed silage from No

TUBULAR
Starts Fortune
If you had a gold mine would you waste half the gold? Dairies are surer than gold mines, yet farmers without separators only half skim their milk. Tubular butter is worth 25 to 35 cents. Cream is worth one cent fed to stock. Are you wasting cream?

Prompt Delivery Assured California Customers from San Francisco warehouse No delays. Address all letters to Bellows Falls, Vt

vember to May. Silage with clover hay, corn stover and bran make up the winter ration. All the feed, except the bran, is grown upon the farm. No grain is sold except wheat. We give salt daily and bed with wheat straw. We feed a little bran or corn at milking time all through the summer. When corn begins to get short in July we finish out with clover hay and grain until second crop clover is ready and green corn. We shall put up a small silo and fill with corn for summer feeding.

We have always kept a registered Jersey bull and saved the heifer calves from our best cows. Two-thirds of the present herd are young heifers of our own raising. What skim milk the caves do not require is fed to pigs, which also get the buttermilk. We aim to raise from 25 to 35 pigs twice a year. We have a weight scale hanging in the barn, also a sheet of paper and pencil, and the milk of each cow is weighed and set down each milking.

The cows are frequently tested for percentage of butter fat. The first year's record could hardly be called a fair test. The second year the cows averaged 250 lbs of butter, the third year 290 lbs, and the past year 300 lbs, with four heifers in the herd.

GRAIN AND ALFALFA FOR HOGS.

In pasturing hogs on alfalfa, we find it advisable to provide a rather large run so that the stand will not be damaged by close pasturage or rooting. The number that can be fed on an acre will depend, of course upon the luxuriance of the growth and the amount of grain fed in addition to the alfalfa.

With an average crop, supposing grain to be fed liberally, it would not be advisable to pasture more than 20 shoats to the acre. In our experiments we have found that a liberal use of grain in connection with alfalfa pasture is cheaper than a small quantity of grain and very much cheaper than no grain on pasture.

Alfalfa can be cut and fed green to pigs and they no doubt relish it more when supplied in this way. In putting up alfalfa for feeding hogs it is decidedly advantageous to use the last cutting, which has a finer stem and correspondingly more leaf. This can be utilized by pigs with very much less waste. If hogs are given a fairly well balanced ration, and charcoal and ashes now and then, they will need no condiments of any sort.

A gain of three or four pounds a day on a hog is physically impossible. If a farmer reports such a gain as this, one may be assured that it is for a very short period and that a large part of this gain is "fill" when the last weighing was made. Two pounds a day is an extraordinary gain and most hogs even when well fed, gain not more than 1 or 1½ pounds per day.—Prof. H. R. Smith, Neb. Exper. Sta.

AGE OF PROFIT FEEDING STEERS.

It requires about one-half as much grain to produce 100 lbs of gain on calves as on two-year-olds. The work of the Missouri agricultural college has demonstrated that the most profitable age to fatten cattle is while they are still young. The older the animal the more food is required to produce a given gain. Other stations have also investigated this question and have arrived at the same result.

The Central experiment station farm of Canada found by comparing 1000 lbs live weight in the case of calves, yearlings, two and three-year-olds, that the profit for each 1000 lbs was: calves, $31; yearlings, $27; two-year-olds, $19.10; three-year-olds, $12.80. When all of the cattle of all ages were purchased at 4c per lb and sold fat at 5c per lb, the profit on $1000 invested in feeding cattle was: Calves, $557.50; yearlings, $284; two-year-olds, $198.75; three-year-olds, $177.50.

Nine-tenths of all the cattle fed in the middle west are two-year-olds at the beginning of the feeding period. When these cattle are in thin condition at the beginning they are often fed with profit. But starting with calves in the same condition it is unquestionably true that they return more profit for each $1000 invested than the older cattle.—F. B. Mumford, University of Mo.

FEEDING YOUNG CALVES.

Keep the little calves warm and dry; at any rate keep them dry. Calves cannot thrive in a dirty, wet pen. Get them to eating middlings as soon as you can, and you will not be so troubled with scours. Skim milk at a temperature of 100 degrees, well cured clover hay and a little mixed grain feed will raise fine calves.

For my pure bred calves I prefer a mixture of one-third middlings, one-third finely ground corn meal and one-third whole oats. A heaping teaspoonful of blood meal stirred in each feed of skim milk will prevent scours. Give the little calves new milk the first two weeks; then gradually add skim milk till at four weeks you have made the change. At four weeks a calf should eat hay and meal, and have the stomach in good working order. Look sharp to the temperature of the skim milk, use clean pails only for feeding, and don't over feed.—M. H. Gardner, Walworth Co., Wis.

FINE SHOWING.

A bulletin of the United States Department of Agriculture gives the value of the shipments of dairy products to Alaska, the Hawaiian Islands and the Philippines for the year ending June 30, 1904, as follows:

Alaska	$270,187
Hawaii	217,850
Philippines	134,549

The value of the butter shipped was as follows:

Alaska	$454,736
Hawaii	99,396
Philippines	10

The value of the shipments of cheese was as follows:

Alaska	$25,574
Hawaii	28,768
Philippines	793

The value of milk (condensed) shipped was as follows:

Alaska	$158,975
Hawaii	89,686
Philippines	133,746

FEEDING SUGGESTIONS.

Alfalfa hay is fine for young calves.

Feed the cows after milking and you will avoid the disagreeable odor from the feed.

Feed sugar beets and beet tops carefully, or they will cause milk to have a peculiar odor.

Hogs getting nothing but corn if given some cowpea hay will do much better than when they are fed corn alone.

It is unnecessary to grind grain for healthy horses having good teeth. It may be well to feed ground grain at noon to hard worked horses that have only a short time to eat.

OATS VERSUS BARLEY.

Editor Cultivator: Will you tell me the relative value of oats and barley for feeding. It is claimed by some that oats have greater nutriment than barley.—L. B. C., Los Gatos.

The official report of the United States Department of Agriculture covering the last ten years, reveals the following figures:

	Bushels per acre.	Pounds per acre.
Barley	25.0	1200
Oats	29.2	930
Difference		270

This gives barley an advantage over oats of 270 pounds per acre, no mean advantage in itself, but this is not the whole difference.

Digestion experiments show that 75 per cent. of the nutrients in barley are digestible, whereas, only 60 per cent. of the oat nutrients are digestible. Calculating for digestible nutrients per acre the result may be expressed in the following table:

	Digestible nutrients per acre pounds.
Barley	900
Oats	560
Difference	340

Barley furnishes, therefore, 340 pounds more digestible nutrients per acre than ots which means about 60 per cent. more than oats.

PARALYSIS.

Editor Cultivator: I am losing some of my pigs from what some of my neighbors call paralysis. When about a week old they seem to become weak in the hips and then they lose the use of their hind legs and then their fore legs and in a day or two are dead. Some of the sows have run on barley stubble before and after farrowing. Others were turned on green pasture about two weeks before farrowing and were fed a small feed of dry barley once a day. Have lost pigs from both lots of sows. The whole litter dies. What can be done to prevent and cure the disease?—J. D. A., Heber.

The paralysis that is killing off your pigs is apparently of a contagious character. I would advise separating all healthy sows that are with pig from the others at lesat two weeks before coming in, and give a mixture of sulphate iron and sulphur. Equal parts. Dessert spoonful once a day in feed.

SKIM MILK FOR CALVES AND PIGS

A profitable product of the dairy, if saved in good condition, is skim milk. Our best dairymen have long ago realized the true feeding value of skim milk. At the Kansas station the result of an experiment with thirteen groups of ten calves each, showed that when calves are worth $3 per cwt., skim milk is worth nearly 20c per hundred; with calves at $4 per cwt., it is worth 30c; and at $5 per cwt., it is worth 40c. The experiment was conducted in a practical way and the results show about the average value of skim milk for calf feeding provided this product is sweet, fresh skim milk fed right. Skim milk fed to calves from a centrifugal cream separator, such as is now within the reach of every farmer, fed sweet and fresh within an hour after it is separated is worth at least twice as much as ordinary skim milk derived from deep setting, open setting or the skim milk from a creamery.

Skim milk is a flesh and bone producer. It is as good for pigs as for calves. The fat required for fat and body heat can be supplied by means of flax meal. Brother farmer, if you have been feeding your skim milk in the old way, stop it at once. Get connected up with a modern dairy separator and feed your milk for profit. It will pay you big.

Tool Tests

Keen Kutter Tools stand every test of a good tool. You can take a Keen Kutter Hand Saw, bend the end of the blade around *until it touches the handle* and it will spring back straight and true. Every other kind of a Keen Kutter Tool is as good a tool of its class as the Keen Kutter Hand Saw. The Keen Kutter brand covers a complete line of tools, and every

KEEN KUTTER

Tool is made of the finest steel and made in the best possible manner by expert workmen. This quality tells in actual use—it means freedom from constant sharpening—it means long and satisfactory service. Even in the beginning Keen Kutter Tools cost little more than inferior qualities—in the end they are by far the cheapest tools you can buy. Keen Kutter Tools have been Standard of America for 36 years and were awarded the Grand Prize at the St. Louis Exposition.

BEST MATERIAL FOR BEDDING.

The best bedding is that which will keep the animals clean and at the same time absorb the largest amount of liquid manures. Straw, sawdust and shavings vary greatly in this respect and recent tests at the Md. experiment station give some interesting comparisons.

To keep cows clean it requires more cut straw than that which is full length. The former is easily kicked about, will not pack down solidly and retain moisture. The same is true of cut corn fodder. Besides this, the fodder has more feeding value than the straw, and, consequently, it could not be used to such an extent as bedding material.

Sawdust is a comparatively cheap bedding where it can be obtained readily, and, everything considered, was the most satisfactory mtaeriai used in the Md. test. It keeps the cows cleaner, stays in place, and is more easily handled than other materials. Quite dry shavings are also very satisfactory, although not so good as sawdust. All requirements considered, ordinary full length straw is the best material that can be obtained on the majority of ranches.

A GOOD HOLSTEIN COW.

Editor Cultivator: In your issue of November 10, 1905, I noticed an article entitled "Remarkable accomplishment of the Holstein."

I read the article carefully and was much gratified to find that our cow, under common ranch feeding, and the old obsolete method of shallow pan setting and skimming, came very near beating the record mentioned.

She is a grade Holstein and averaged 44 pounds of milk per day, and made over 15 pounds of butter in seven days.

What would she do with scientific feeding and the improved method of handling her product?—C Mc. D., Hemet, Cal.

VETERINARY DEPARTMENT

BY DR. W. J. OLIVER,
318 East Second St., Los Angeles

To the end that this department may be made as valuable to the subscribers as possible, we ask observance of the following: Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease ap eared. Give your name and address, which will not appear in the paper if you so request. No charge whatever is made for such questions as are answered through the colums of the Cultivator, but when an immediate mail answer is wished Dr. Oliver asks an additional fee of $1.00 and will give immediate attention and reply by mail. In such case write Dr. W. J. Oliver, 318 E. Second St., Los Angeles, Cal.

Questions should be in by Monday to be answered in the following Friday's paper.

CONTRACTED NERVE.

Editor Cultivator: I have a horse whose left eye is partially closed, can open the lid with my fingers but it closes again and remains so. What should I do?

Your horse has nerve contraction. Apply warm application of flannel for and hour and rub with liniment being careful not to let any of the fluid enter the eye. If this affords no relief see a veterinarian.

* * *

ECZEMA.

Editor Cultivator: I have a heifer eighteen months old. The hair on her tail is falling out. The end of the tail is dry and scaly. She appears well, eats hearty, runs in pasture and has both dry and green feed. What is the trouble?—S. Ruburn.

This is a form of eczema affecting your cow.

Wash the parts clean and apply Kreso dip 3 ounces to quart of water, repeat twice a week.

* * *

LUMP ON JAW.

Editor Cultivator: Will you please advise us through the Cultivator for our cow.

She has a lump under her jaw, otherwise she seems perfectly well, her horns are warm, she eats good and will calve in February. We had to dry her up as her milk tasted bad. She has not been with other cows. If you could tell us what to do we would be thankful.—C. R. P., Campbell.

You don't state whether the lump is attached to the bone or where located. You probably have a case of actenomosis or lump jaw. But that would not cause bad taste in milk.

Treatment if on jaw bone: Iodide potassium, 2 drams twice a day.

* * *

SALIVARY DISCHARGE.

Editor Cultivator: I have a mare nine years old. She is fed on oat hay; when she eats the water runs from her mouth, so that by the time she finishes half of it, the other half is so wet that she don't want to eat it. She is quite thin, but has a good appetite. Please inform me in your paper the cause and remedy.—J. W. S., Lakeside.

This watery discharge is saliva; there is some irritation of the salivary glands, probably from some foreign body getting into the opening. Examine well under the tongue and in the inside of cheek over the third molar tooth. Remove the obstruction if any—gargle the mouth three times a day with alum powder; tablespoonful to pint of water.

* * *

DIABETES.

Editor Cultivator: I have a fine four-year-old horse, gentle but high life. He passes water very often, usually very slow. Sometimes in large quantity; often time in small quantity. It will run off without any effort, apparently.

Has a ravenous appetite; keeps in rather poor flesh. Does very light work. Can you from the above description prescribe a remedy to check the frequent passing of urine.—G. R. S., Santa Ana.

This is diabetes. Give 1 ounce of Sanmetto twice a day in feed or with syringe on tongue.

* * *

BRUISED TEAT.

Editor Cultivator: Will you please tell me through the Cultivator what to do for my cow? When I go to milk her she gives quite a lot of blood out of one of her teats. She is a young cow, with first calf and gives a nice lot of milk; she eats well and is alright otherwise. She has been doing it quite a while, sometimes it makes the milk quite red.—J. P., Hynes.

This cow must have bruised the teat lying down; see that she has a comfortable place to lie, and nature will do the rest.

THE MILKING STOOL.

We know a milking stool is used to sit on, and too frequently to pat the cow with, but not every one knows that the kind of stool used plays an important part in the number of cows a person can milk without fatigue. Stool should be made to suit person using it, and be rather high; high enough so that when used the milker's arm from shoulder to elbow hangs nearly straight down. The weight of the arm then comes naturally on the shoulder, and it is not necessary to raise the whole arm when grasping the teats at each stroke. Moreover, it is much easier on the cow than when a low stool is used, for, in this case, the milker, after grasping the teat, rests the whole weight of the arm on the teat and this, with the jerking, is not conducing to comfort for the cow. A stool of the proper height will enable most milkers to handle fully one-third more cows without fatigue than if stool is too low.—R. E. Dimick in Successful Farming.

IMPORTING MILCH GOATS.

It may not be generally known that the government is looking into the question of importing goats to take the place of cows in the dairy. The prevalence and spread of tuberculosis in the Middle West, among milking stock, has brought about this investigation.

The Bureau of Animal Industry has had an agent in Europe all summer investigating the goat industry there, and he has already shipped fifty head secured on the island of Malta and more are to follow from the mountains of Switzerland. With these, and others of different strains, experiments will be conducted at Storrs, Conn., and it is believed that there is a great future for the industry in the United States.

"Goats are immune from tuberculosis," says the dairy writer in the Dakota Farmer, "and this alone ought to guarantee them a welcome in such centers of population where the people are fed on milk from tubercular cows, as development within the year has proven that many are." Additionally, many poor families that cannot keep a cow—and thousands cannot that are not termed "poor"—can keep a milch goat, and have rich wholesome milk for the children and themselves.

From the flock of Angora goats brought into Imperial valley late last year, Clarence E. Conant sheared three weeks ago a clip of mohair that will aggregate full 2500 pounds. Shipment of the clip will be made this week to New York, where the present market price is from 22 to 33 cents per pound.

PUMPKINS FOR MILK.

Are pumpkins good milk producing food for cows and are the seeds harmful?—J. A. B., Charter Oak.

Pumpkins are regarded as good feed for cows used with some salt.

Advertising Column for Members
OF THE
JERSEY BREEDERS ASSOCIATION
OF SOUTHERN CALIFORNIA

Organized for the general advancement of Jersey interests, to extend knowledge of their superior merits, for the mutual benefit of members, and to increase the profitableness of one of the State's greatest industries. Breeders are requested to unite with the Association.

Must be Sold by January 1st, 1906

Having sold my ranch. I am forced to sell 40 head of Registered and Grade Jerseys Ten registered cows, milking now; 4 young heifers, eligible; 8 bulls, registered or eligible; 18 cows and heifers, pure bred and grade, not eligible. This herd represents some of the best blood on this coast. Parties wishing to see the stock can take Santa Ana electric car and get off at Hansen. Station is right at the ranch.
W. J. Cole, R. F. D. 1, Anaheim, Cal.

BULL FOR SALE

Having sold my ranch I am forced to sell Golden of Biltmore 60082, a grandson of Golden Lad's. Golden of Biltmore is one of the best, *if not the best* sire on the coast several of his daughters less than two years old selling for over $200 each. Highest bidder for next sixty days takes him. If everything is not just as represented. I will give anyone the *bull free of charge. I sell on merit.*

OPERATING AN INCUBATOR.

(Continued.)

As I said in commencing my talk about incubators, each incubator requires slightly different handling, so follow the directions which are given with whatever incubator you have. There are, however, some general, common sense rules which apply to all of these, the first of them is about turning the eggs.

* * *

Turning the Eggs.—The eggs must be left for forty-eight hours after they are placed in the incubator without turning. After that they should be turned twice a day or oftener. I have read that a setting hen turns her eggs about eight times a day and twice during the night. I do not know how the writer discovered this, but I know I have watched a hen, through a crack in the barn, where she will not know any one was observing her, she kept on gently pushing the eggs under her, first on one side and then on the other, changing the position of the eggs at every move, and pushing those that are on the outside into the center of the nest. If you follow the hen's example and not only turn the eggs in the incubator but move them, shifting their position on the tray, you will have a much better hatch than if you leave them in the same place on the tray. The eggs need not be turned clear over. The best plan is to lift out the two center rows in the tray, roll the others into their place with the hand and place those from the center on the outside. It is really more important that the eggs be moved from their location than merely turned, as this changes the position of the eggs in regard to weak germs or infertile eggs. Turning the eggs in this way by hand is much better than by the automatic turning device, and safer than using an extra tray which is placed on top of the full tray and both inverted. This way of turning is very fatiguing especially to a woman and frequently results in cracked eggs.

Turning and moving the eggs gives exercise to the embryo for the germ floats always at the upper side of the egg and when the egg is turned the germ has to move to the upper side. This moving exercises and strengthens the chick and makes it vigorous. In the large incubatories in Egypt where as many as six hundred thousand eggs are hatched in one season in one house, the man and boy, whose business it is to attend to the eggs, keep them rolling along constantly, pushing them gently with their hands and arms, and failures in hatching are unknown in Egypt.

If the eggs are not turned during the early stages of incubation, the germ may dry fast to the shell and the egg will be lost. Where the egg is not turned during the latter period the embryo does not develop properly, and has little chance of hatching out, or may result in a cripple.

The first forty-eight and the last forty-eight hours the eggs should not be turned. The reason for this is that during the first period the germ must have perfect rest, and during the last two days the chick has to turn itself in the egg and should be allowed to rest in order to commence to pip the shell at the upper side.

* * *

Cooling the Eggs.—The next thing to consider is cooling the eggs. Here let us follow the example of the hen. For the first few days Biddy comes off the nest seldom and appears in a hurry to return to it. As the days pass by she apparently becomes more careless and remains off so long that it becomes alarming and one fears that the eggs will be quite cold, however, the last two days when she hears her babies crying in the shell she does not leave the nest, but she sits high, almost standing up and she does not turn the eggs.

An experienced poultry breeder can tell at a glance when a hen is about to hatch by this change in her demeanor.

The cooling of the eggs I consider an important matter in our American incubators, although it is not practised in Egypt. In many of our incubators, where the ventilation is imperfect especially in hot water machines, it is the saving of the eggs as they then get their supply of oxygen for the day.

The first week, following Biddy's example, the eggs require but little cooling beyond the time it takes to turn them. The door of the incubator should be kept closed during the time the eggs are out of the machine (unless the instructions for operating order otherwise). The second week, as soon as the eggs are turned, replace them in the machine and leave the door open for five minutes, after this increase the time a minute or two each day till at the end the eggs are being cooled fifteen or twenty minutes.

* * *

Cooling the eggs renders the shell brittle. I am not scientific enough to tell you how this is done, but I know that as the eggs warm up again an almost imperceptible moisture comes over them (similar to, only not so much, the moisture outside a glass of cold water on a warm day,) this moisture takes the place of the perspiration of the hen, and obviates the necessity of dampening the eggs. I think it may be this that not only makes the shell brittle but renders the lining skin inside the shell less tough, or it may be that the cooling and heating with its certain shrinking and expanding of the shell makes it brittle.

But one thing I do know and that is if the eggs are properly turned and aired the hatch will be a great deal better than if these important duties are neglected. A hen that sits too closely and does not air her eggs will not have vigorous chicks, and will have chicks that die in the shell. So with an incubator, if the eggs are in-

(Continued on Next Page)

FEEDING FOWLS BY MACHINERY.

During the year 1905 Armour & Co. added a poultry feeding department to their plant, the only one in operation here. Twenty-five hundred birds of all descriptions, says an exchange, are now on feed there constantly. For one who has never seen a department of this kind it is a novel and interesting sight. The poultry are fed by machinery with a food specially prepared from packing house products, some wheat flour and other ingredients.

Feeding by machinery sounds rather strange, but it is true nevertheless. The food, which is thinned into liquid form, is put in a small tank, having a compressed air arrangement and tube attached thereto, is placed in the bill of the fowl to be fed. At the slight pressure of a handle the matter is forced into the craw, and the chick, turkey or goose has to take his rations whether he wants it or not.

This system is called "stuffing." It requires 21 days to finish a fowl for the knife, but when it is killed it shows the beneficial effect of the operation. This is only one more of the many resouces of a modern packing house.

Add a gill of oil of sassafras or crude carbolic acid to each gallon of kerosene when spraying hen house. The acid is a disinfectant while the oil of sassafras will drive away ants and other insects.

Ducks must have dry quarters at night, even if they do live in the water through the day. The greatest half of any disease is eliminated by removing fowls to dry quarters.

The hen steals her nest away from the house and roosts on trees, vines and farm implements to keep away from the blood-sucking mites that harbor in the poultry houses.

"Where is the twelfth juror?" exclaimed an Idaho judge, as court reconvened after a recess, with only eleven good men and true in the box. One juryman arose.

"Please, Judge," said he, "it's Ike Simmons as is gone. He had to go on private business but he's left his verdict with me."

YOU WILL FEED NO OTHER

Used by all the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the GOLD MEDAL at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.

And Now Comes New Reward for Merit:

Read the following telegram received from the Lewis & Clark Exposition at Portland:

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

WRITE FOR CATALOGUE 47—A BEAUTY

PETALUMA INCUBATOR CO.

San Francisco Office and Salesroom, 33 Market St.

sufficiently cooled and aired there will be chicks dead in the shell.

* * *

The length of time for cooling the eggs must be governed by the heat of the room in which the incubator stands. When the temperature of the room is between fifty and sixty degrees, during the last week, about fifteen minutes is the proper time for cooling, when the temperature is between sixty and seventy degrees, twenty minutes, and if it is seventy or eighty degrees, half an hour will not be too much.

* * *

EDITOR'S QUESTION BOX.

Charcoal, etc.—(W. K., Los Gatos). Kindly instruct me how to burn charcoal for chicken use. Also how to burn bones for the same purpose. Would it not do to mix wood ashes in the food instead of coal. Our wood here is live oak. Since I started the dry feeding according to Mrs. Basley my chickens have loose yellow droppings. What shall I do to keep their bowels in good condition?

Answer.—Charcoal is usually made from wood. The wood is stood up on end in rows, making a large cone-like heap, which is covered with turf, holes being left at the bottom for air to get in. An open space for a chimney is left at the top and the wood burns slowly from top to bottom and from center to outside. When fully burned, the heap is covered and left to cool for a few days. You might burn bones at the same time. I think it would be better to buy the charcoal at your nearest fuel store. Then pound it and grind it in your grist mill.

Tell me exactly the proportions of the dry feed that you are giving your fowls and I will tell you where it is unbalanced. Probably a little too much protein, but I can only guess at it, as I do not know what you are feeding. Mrs. Basley gave several formulas for dry feed. Wood ashes must not be mixed with the food of the hens; it would make a lye that would be very harmful.

* * *

How Much Food?—(W. F. K., Los Gatos). Six months ago I bought a few half breed Plymouth Rocks. Fitted up yard and cared for them as you direct in the Cultivator. Have now a fine lot of pullets and young roosters.

I wish your advice as to whether Barred Plymouth Rock is a good kind to raise; what foods to use from start to finish to produce fine flavored meat and plump but not over fat chickens. What is the exact amount in weight (say for each 50 hens)) of food that chickens should consume per day to be thrifty and in good laying condition? From all I read I really cannot find out just how many ounces of food each chicken should get per day, even the bulletin (No. 164) does not state plainly this most vital item. Kindly answer, at your earliest convenience of course, I suppose through the Cultivator.

Answer.—I am glad you are having such good success with your poultry. Barred Plymouth Rocks are an excellent table fowl; you could scarcely have any better. If you have fed according to my directions in the Cultivator, sweet clean food and plenty of green food with clean spring water your fowls will require nothing else to make fine flavored flesh. I would, however, suggest that you finish off the feeding by the French and English method of cooping the fowls in small coops and feeding them three times a day equal parts of corn meal, oat meal and bran, all they will eat in twenty minutes. Mix the ingredients with skimmed milk. Three weeks of this feeding will make as delicious and toothsome a fowl as you ever tasted.

The rule for feeding fowls which meets with good results is feed one ounce of the dry food for every pound of weight of hen. Your fifty Plymouth Rock hens would require about twenty pounds per day, not counting green food which they would pick up.

* * *

Marketing Turkeys.—(J. R. H., Orange). Will you please answer in the columns of your valuable paper how to dress turkeys for the market properly, should they be scalded or not and should the head be left on. Also if turkeys can be caponized and at what age; what is the effect on them?

Answer: The heads are usually left on, the turkeys being killed by bleeding from the mouth and piercing the brain. Private customers, however, often prefer the heads to be cut off and the turkeys killed by decapitation. The commission houses in the cities will usually furnish shippers full instructions for dressing, packing and shipping turkeys and other poultry as market demands are not the same in all cities.

In preparing turkeys for market first save out your best, most vigorous and largest birds for your own breeding stock for next season. Do not trust to the later hatched birds developing in time to make good breeders for next year. Keep the very best you have for this. Second: is it very important to prevent the turkeys from being frightened and bruised when caught for killing, the best plan is to catch them at night, keep them in a coop or box without food for about twenty-four hours, unless you have cooped them to fatten them for two or three weeks. A turkey that is bruised looks very badly and will not bring a good price.

Turkeys can be picked dry or scalded. In the East they are always dry picked, but here they are scalded. It is easier to pick them when scalded. The success of the operation depends upon having the water at the right temperature, as near boiling as can be, and yet not quite boiling. If the water is not hot enough the feathers are not loosened enough, and if it is too hot, the skin is partly cooked, will tear very easily and the body when cold will be discolored in spots. Never pour the water on from a teakettle, have a wash boiler on, or a five gallon oil can will do, and when it boils take it off the fire, add a pint of cold water to stop it boiling, take the turkey by

its legs and head (that the head may not be discolored) and souse it up and down in the water, as soon as the feathers are loosened (try a few) stop sousing, hang it up by its feet and quickly remove the feathers, using both hands, with a wiping off motion which is easily acquired, pull the quill feathers carefully so as not to tear the wings and remove all the pin feathers. Then plunge the carcass into scalding water for a few seconds to plump it then into cold and hang it up to cool. Do not pack for shipping for twelve hours, or until perfectly cold.

Turkeys cannot be caponized successfully.

* * *

Sick Turkeys.—(A. C. E., Holtville). As I am a beginner in the poultry business, I have decided to appeal to you. I have lost three turkeys with a disease strange to me. They become sick, the head turns purple, there is great heat in the head and neck and they die in twenty-four to forty-eight hours. Then, the chickens get dumpish, sneeze, fall away in flesh and finally die. There is no swelling of the head or symptoms belonging to roup as I understand it. They have no lice or other cause to be sick. They have feed twice a day of corn and run on alfalfa. Will you please define the trouble and the remedy?

Answer: Your turkeys undoubtedly have "black head (infectious Entero-hepatitis)." This is an infectious disease, cause by microbes and resembles typhoid fever in human beings. Cushman, an authority on this subject, says: "The disease takes its name from the turkeys becoming purple about the head. It is an infectious liver disease. Turkeys having the disease affect the land they run upon. The organisms (microbes) are present in their excrement, and if taken in with food or water, may produce the disease in other turkeys. Sick birds should be killed and burned or deeply buried. Buildings, coops, feeding and drinking vessels should be disinfected. Take great pains to clear out the sick from both young and old, and then, if it is possible, change the well ones to new ground. Little turkeys are most susceptible to it. Wet, stormy weather aggravates the disease. The feathers look rough; they have diarrhoea, with bright yellow excrement; and they weakly drag one foot after the other some time before they die.

Prevention is possible, but cure is difficult. A tonic and stimulant for liver and bowels will help prevent the disease; confinement and over feeding favor it."

Dr. Salmon says: "Where a flock of turkeys has recently been affected it is well to try some remedies, with a view to arresting the disease in the mildly affected birds, and of preventing the infection of others by making the intestinal contents unsuitable for the multiplication of the parasite.

Sulphur 5 to 10 grains, sulphate of iron 1 grain may be combined and given at one dose, or one grain of quinine may be added to this. Hyposulphite of sodium may be useful in doses of two to four grains. It is necessary that these remedies be repeated two or three times a day and continued for a considerable time. The doses mentioned are for turkeys weighing four or five pounds."

* * *

Mating Turkeys.—(Mrs. G. E. D., Tropico). I have seven turkeys raised this year, six hens and one gobbler, all from the same hen, so they are related. Can I mate that gobbler with the hens next spring, or had I better change? He is seven months old and weighs 16 pounds, he is such a beauty that I dislike very much to part with him.

Kindly answer as soon as convenient.

Answer: You had better get another Tom to mate with your hen turkeys. Turkeys deteriorate in size and vigor if inbred more than any other fowl.

* * *

Sweet Peas.—(Mrs. H. Oceano)—Would sweet peas as regular feed be injurious to pigeons and ducks? What would be the effect of feeding raw or feeding cooked?

Answer: I think pigeons would like sweet peas raw and that no bad results would follow the use of them, I advise you to try some before buying. Mix some with your pigeons' wheat and note the effect.

Ducks do so much better on mashes than on grain that I think you would have to cook the peas for them. The protein content of all peas and beans is high, but is is sometimes quite difficult to persuade ducks to eat a new food, so my advice would be to experiment a little before buying sweet peas, and soak the peas over night before boiling, then boil the animal food that you are feeding with the peas add twice the amount of bran after the peas are cooked and see how the ducks take to it. It is a good deal of trouble and unless you have the peas or can buy them very cheap, say at not over fifty cents a hundred it would not pay.

* * *

Feeding Corn.—(Mrs. M. I. B., Upland.) When feeding corn with other grains to chickens as a part of their regular rations, is it better to feed cracked or whole corn?

Answer: It is better to feed cracked corn, because the grains being smaller it takes longer to eat; half a dozen pecks for each grain when cracked, this makes a hen eat more slowly and is less trying to the digestion.

Roup.—(D. C. G., Palermo). Would you please tell me through the Cultivator what ails my chickens, if they can be cured, and also give remedy? They commence with their eyes and head becoming sore and swollen, their throat seems to fill up and later on the joints of their legs become swollen and blue, as though bruised, then at length, they lose the use of their bodies and refuse to eat.

Answer: Your chickens have the roup. Use one of the remedies given in a September issue of the Cultivator. You do not state age of fowls, nor breed, or I could give more explicit directions. Matured fowls require about the same doses as human beings. Always state age and breed when writing for advice.

DRINKING VESSELS FOR FOWLS.

The Cultivator has repeatedly called attention to the necessity of clean drinking dishes for fowls. They should be washed daily, once a week scalded in hot water with lime or gold dust to clean them of bacteria. They do not require the same capacity as feeding troughs. It is enough if a few fowls of the flock can drink at a time. It is always advisable, however, to arrange the vessel in such a manner that fowls cannot get into it with their feet. The vessel might be enclosed with a box. A good way to serve drinking water for two adoining pens of fowls is: An opening is cut into the partition wall, a board fitted in for the pan to rest on, and the pan being placed right under the partition wall so that one-half of it extends into each pen. The fowls cannot easily get into it nor upset it. In warm weather we must in some way solve the problem of how to keep a constant supply of pure, fresh water before the fowls, young and old, and this object is worthy of serious attention. If we give the water in shallow dishes, the supply must be often renewed, and the vessels frequently emptied and thoroughly cleaned. Practical Farmer recommends washing out with Bordeaux mixture, or copper sulphate and lime in solution, is perhaps one of the best ways of cleansing the drinking vessels. It is as good and effective a disinfectant as anything that could be used. A running stream from brook or hydrant, a clear creek or lake where available will, of course, furnish the ideal water supply for the fowls or other domestic animals, especially during the warm season. Where such a supply cannot be had, as in the mojority of cases, a tight double-headed barrel, thoroughly cleansed out and kept pure and sweet by an occasional rinsing with Bordeaux mixture or other disinfecting fluid, can serve as the next best thing if set into a tight box and so arranged, by inserting a faucet into the barrel side just a trifle lower than upper edge of box and hole with cork stopper in head of barrel, that the water from the filled barrel will run out just fast enough to keep the box nearly full.

When the barrel is once filled and kept in the shade, or still better, if a cloth is covered over it with lower end hanging down into the box, so that there will be a good-sized surface for evaporation, it will supply good water for fowls for quite a while.

Feed your chickens on boards and so avoid the gape worms that are liable to be picked up from the ground.

General Agricultural Notes

FARMERS' NATIONAL CONGRESS.

As the time for meetings of various agricultural organizations is at hand, when many of the leading farmers of the country will meet for discussion and friendly intercourse, attention is called to the Farmers' National Congress. It is the only all-round national agricultural body in the country which meets annually to discuss broad national agricultural problems, and to pass resolutions. There is a field for such an organization, and the one above named has had a useful and successful career for 25 years. But its officers and friends desire to increase its usefullness and to have it even better attended and more representative than in the past. More than 95 per cent of its members are actual farmers. The others are editors or proprietors of farm papers, officials of national or state departments of agriculture, and others in close touch with agriculture. There is no fund for paying expenses of delegates to the annual sessions. This includes the officers, who serve without pay. The Congress does not include in its membership the element that seeks a free junket or personal advantage. Another session will not be held until next autumn, but the present is a favorable opportunity to consider it, and bodies which meet only once a year and that in the winter, can take action, should they desire to do so, only at this season. The Congress is composed of delegates from the different states, appointed as a rule by the governors of the states, but official representatives from live agricultural bodies are always welcome, and when such representatives are duly elected by their respective organizations, Governors will doubtless be very willing to appoint them as state delegates to the next Congress.

George M. Whitaker, Secretary. P. O. Box 1332, Boston Mass.

EXPERIMENTS WITH EUCALYPTUS POSTS.

Experiments with eucalyptus timber are being conducted at Ellwood, Santa Barbara county, by Robert W. Ayres, who arrived a week ago from Washington, D. C., direct from the forestry service. The Santa Barbara Press says: "Mr. Ayres' first work is to experiment with encalyptus for use as fence posts. He has secured the benefit of the co-operation of Ellwood Cooper, the State Horticultural Commissioner, who has given him the use of posts from the fine eucalyptus timber on the Cooper place at Ellwood. The Government's offer is to treat without cost posts that are furnished by land owners, who will use the posts as they are treated and report to the department on the result. While the work is largely experimental, there is sufficient promise of benefit to repay the farmer for his trouble in taking the posts to and from the treating plant located on the Cooper ranch.

The posts are dipped in creosote which has been found to be about the best preservative for such purposes. While its effect on cucalyptus has never been officially tested, it has been in extensive use in the South for the treatment of piling for the swamps; and the Southern woods treated with creosote have been given a life of twenty-five to thirty years against three to five years for the same class of timber not treated. Experiemnts with the eucalyptus for wharf piling along the Santa Barbara coast have already given encouragement to the further planting of these trees, and the co-operation of the department at this time will result, no doubt, in further stimulus.

Redwood posts are now in general use throughout California and cost at this point from 15 to 20 cents. It is thought that eucalyptus posts can be grown for 5 or 6 cents and the cost of treating is from 2 to 3 cents. If the result of the treatment will give a post that will last as long as the redwood, there will be a saving in cost of one-half.

The posts are usually dipped for a depth of 3 feet, to allow about a foot to extend above ground. In some instances, for the sake of experiment, the entire post is immersed. A tank with a brick furnace underneath has been provided. The creosote is applied while at the boiling point.

A NEW WAY TO POISON COYOTES.

An Oklahoma farmer discovered that coyotes had grown too smart to eat poisoned bait which had been left around where they could get it and worked the double-cross on them with great success. He put himself in a coyotes' place and reasoned that if he could find a piece of meat that had been buried there would be no danger in digging it up and eating it. The farmer then strewed some unpoisoned bait out on top of the ground, and buried the bits which contained the strychnine and watched results. The buried bait was dug up and devoured and for each one he found a dead coyote. Perhaps the suggestion may be worth something to the cattle men down this way if the animals are wary of the ordinary bait.—The Ranch.

It is now estimated that about three hundred acres of East Whittier and La Habra land will this winter be devoted to the raising of cabbage.

U. S. Department of Agriculture, Climate and Crop Bulletin of the Weather Bureau, California Section, for the week ending Monday, Nov. 20.

The weather was generally clear and cool in the central and northern sections and warm and clear in the south. Frosts occurred in portions of the interior, but caused no damage. Light rain fell in some sections on the 16th and 17th and general light rain in the central and northern sections on the 19th. Cool north winds prevailed at the close of the week.

The rain was beneficial in many respects, but was too light in most places to soften the soil or start pasturage. The atmosphere was cleared and forest fires in the foothill districts were extinguished. The soil absorbed all of the water that fell, but more rain is needed at once to enable farmers to complete plowing and seeding. In the southern section the soil is in excellent condition since the recent heavy rains; pasturage has started and farm work is progressing rapidly. The drouth in the central and northern sections has been the longest in recent years, but as yet the farming interests have not suffered seriously, the principal injury having been to stock raisers, dairymen and mining.

The weather was especially beneficial to Southern California oranges, which are ripening rapidly and look well; it is expected that some shipments will be made for the Thanksgiving trade. Orange picking continues in the Porterville and Oroville districts and considerable quantities have been shipped. Walnuts and olives are being gathered.

Queries and Suggestions

EMPEROR GRAPES.

In reply to several correspondents as to pruning and control of mildew of this variety of grapes, our vineyard practice is as follows:

Pruning.—The Emperor vine is a shy bearer unless rightly pruned. When trellised it over-sets with fruit and produces a large quantity of small bunches of inferior grapes, that often fail to ripen. When low pruned it runs to leaf growth rather than fruit. The approved pruning is that of staked vines, with crowns four or five feet from the ground.

In buying stakes we prefer them six feet long, as they can then be re-driven two or more times, for they rot off after a few years. It pays to char or tar the end that goes into the ground.

The young vineyard is simply let grow the first year without stakes; at the first pruning, if the growth is long enough the strongest canes are selected and tied up one, two, sometimes three of them to the stake and they should be at least four feet long. The top buds often look weak but can be depended on to push out promptly when tied up, as vine growth naturally starts out at the top of the shoot when the growth is upright. There will always be vines in a young vineyard that cannot be staked until the second year ;these are pruned to one or two buds eight or ten inches from the ground. Now to return to the young vineyard that we were shaping up—down on the side of the canes that are tied up trim off the laterals except one about ten inches from the ground, cut this to two buds to form a spur for next year, as on this spur we depend for the wood to renew the top when necessary. The next pruning the young vine receives two or three buds of the new growth at the top should be left to form spurs for the top crown; this is continued each year until the crown becomes too much tangled when one spur may be entirely removed and new growth brought up from the lower spur again, to take its place.

In case the vineyard has been low pruned for a number of years and it has to be re-formed into a high staked vine, one or two canes are carried up to the top of the stake and cut off at a bud pointing outwardly and tied firmly. At the low crown cut off two spurs for every cane carried up. If this only leaves one for the low stump the vine is then pruned the next year the same as the young staked vine. If more than one spur is left it is removed the second season, the reason for not taking away more than we provide for is that the excess of sap may break through the tissues of the vine and black knot start to grow on the weakened spot. While this is a brief outline it covers an experience of ten years with the Emperor grape and a long series of experiments entered into to be sure of the best way.

We have found that winter spraying with Bordeaux makes the use of sulphur some years superfluous. This is not in accord with the University Viticulturist teachings, as they believe in two or three sulphurings.

I can only give you our practice here as you ask for that, but would have you consider that we are in the dry interior and that you had best experiment a little for yourself. We spray heavily in the winter with Bordeaux, waiting for a dry time to do it. This takes the carried-over spores of the mildew clinging to the vine; we prefer this as less expensive than the sulphur. Then we watch carefully, and if the slightest mildew shows we use sulphur promptly. At first we were very timid about trusting to Bordeaux but now find that when we have any mildew showing it is along the creek bottom where it is probably an infection from weedy growths. When the use of sulphur is practiced, the first application is at the time of of the first growth, when it is not longer than an inch or so; the second when the fruit is set, and the third when it is needed.

The best quality of sulphur should be used and as finely ground or pulverized as possible. The old way of shaking it on with sacks is wasteful; use small bellows, or, better yet, a knapsack arrangement carried on the back of the man doing the work, with a blast attachment to force the sulphur under, as well as on top of the foliage. —Minna E. Sherman.

WALNUT MARKET.

Editor Cultivator: I have a half ton or more, of soft shell walnuts, and several of my neighbors have similar quantities. Our grocers do not offer what seems to be a fair price. Would you kindly give us the address of some association of the walnut exchange, which would probably either buy or ship our walnuts on fair terms? We know not whom to address, and indeed, are very ignorant about the walnut business.

Should it be necessary to hold our walnuts for a few months; is simply keeping the sacks in a dry place all that is necessary, or is there danger from worms?

If you will kindly answer the above inquiries through the Cultivator, it will accomodate several of us.—B. E., Riverside.

Buyers of walnuts are very shy this year, but we think that if you will write to Percy R. Wilding Brokerage Co., Los Angeles, Cal., they will buy your walnuts. The associations do not buy and ship only for their members.

Walnuts can be kept in a cool, dry place until the weather begins to get warm next spring, say about April 1st, without any damage. After that there is some danger of them turning rancid. There is no danger from worms, unless the shells have opened from being excessively dry, and have stayed open several days.

WILD MORNING GLORY.

Editor Cultivator: Morning glory and how to kill it seems to be a puzzle to some of your correspondents. Expensive methods have been suggested, such as salt, covering the ground with tar paper, etc. I will give a simple method which I know to be infallible. As soon as the weed starts in the spring, go over the ground with a common weed cutter, cutting below the surface four or five inches, follow it up every week for one season and you wil have no more trouble with that pernicious weed. Do not forget and let a week pass and allow the weed to come to the surface and breathe, or the work will have to be done all over again. The philosophy of the method is very simple. All plant life must have air and sunlight; deprive them of this and they die.

The Cultivator contains a large amount of valuable information for the wealth producers of the Pacific Coast and I have given this item hoping it may be useful to some of my fellow tillers of the soil.—H. B. Lydiard, Cupertino, Cal.

JOHNSON GRASS.

Editor Cultivator: What is the relative feeding value of Johnson grass. What are the best means for its extermination. Is it worth the trouble to prepare infested ground for a better crop?—W. W. C., Pasadena.

The feeding value of Johnson grass is very high and in many parts it would be extensively grown did it not spread everywhere, even where it was least desired. The best means for its eradication is plowing and constant harrowing and cultivation during one summer, leaving the land without a crop for the one season. It is not hard, as many suppose, to rid land of this pest if treated in this way. If you attempt to dig it out by the roots it will prove an insurmountable task. The theory is that no plant can long survive without both top and root. Keep the tops cut off a little under the surface, so that it has no chance to breathe and you will soon be rid of it. It is a question of eternal vigilance for one season. The land certainly is worth preparing for another crop, anywhere in your section, although the land is evidently not near the address given (Pasadena) for Johnson grass seldom thrives on the higher lands.

VINES ON HOUSES.

Editor Cultivator: Will you kindly answer the following questions? 1. Do you believe in winter cultivation in orchards? 2. Wish to paint house; vines and climbing roses cover porches and side of house. Will cutting them down so as to give a chance to paint injure them?—G. R. S., Santa Ana.

1. We do.

2. Cut all such vines to long main shoots, relieving them of all side shoots. When you replace them they will, in case of such pruning, cover with a skeleton growth nearly the same area as before. New side growths will quickly appear.

WALNUTS AND APPLES.

Editor Cultivator: What will determine, without much trouble, the suitability of lands for apples and walnuts, especially in the Downey district.—W. W. C., Pasadena.

Any heavy lands around Downey should be good for apples. The lighter lands should be chosen for walnuts, but you must avoid getting down in the cold river bottoms in some districts. The warmer and freer from frost a section is, the better it will be found for walnuts.

DEWBERRY, BANANA AND LILAC.

Editor Cultivator: (1) Please tell me how to prune dewberries which were planted last spring and have made a good growth. (2) Should the side shoots of the banana be allowed to grow around the old stalk? (3) What do lilacs require in the way of fertilizers, etc. Our bushes do not seem to thrive; they send out new buds and leaves and these wilt and drop and a new lot appears.—G. B., Upland.

(1) Better leave your dewberries now, until after next spring's crop is off, when you should cut the canes off at the ground. They will then make the growth necessary for the bearing of the next year's crop.

(2) Certainly; the beauty of the banana is best shown in a large natural clump; allow it to grow as large as it will, as after fruiting the stalk dies and the younger ones are needed to take its place.

(3) We do not know the specific trouble with your lilacs, but the plants seldom thrive in our state as they do east of the Rockies, particularly in the hot dry interior of the southern part. They like partial shade, a cool place, a fair soil but somewhat damp. Note if the leaves are troubled with a white mealy fungus or if borers are in the branches or roots. We fear that both your air and soil is too dry.

THANKSGIVING.

Let not this day go forth uncheered,
Though all the world looks sad;
Within our hearts are life and light,
Be thankful and be glad!

Let praises now from land and sea,
Rise on this joyful morn;
In glad thanksgiving strong and free,
For Nature's plenteous horn!

—Louise Lewin Matthews.

In Love's Own Way

It was delightful to be at home again. I had been away so long that I felt myself almost a stranger, even with father and mother.

The little town had grown miraculously, I thought, and the dear old home place had changed, too, and very much for the better. The lawn, where there used to be so many sand burrs, was beautiful now, and the trees had grown so that the house stood in a cool shady grove. How old that made me feel! I could remember when those trees came up from the seed, and I used to be told not to step on them when I went out to play.

Even aside from the fact that it was home, this was an ideal place to rest, and rest was what I needed. I had been working very hard and was almost broken down.

The family were all sympathetic and ready to do anything for me. I found a hammock and cushions placed for me in a shady place and a pretty room, my own dear old room, all refitted for my use. The room and the hammock were very satisfactory, but it made me feel a little oddly to find a carriage awaiting me at the station, with pillows in the back seat. The home people had got the impression that I was really an invalid.

I accepted their attentions, however, as gracefully as possible, and since outdoor air was considered best for me, the hammock became my headquarters for the summer.

I had a dreadful experience there one evening. Father and mother had gone to a neighbor's, and my sister, Ella, was at the choir rehearsal.

I was watching the sun go down when they went away, and mother said that as it was warm I had better stay out until Ella came home (she would come first), and then she would carry in the cushions for me. So after the sun had set and it was quite dark under the trees, I still lay there thinking about the work I was to take up in the fall.

Presently I heard the gate shut, and then footsteps on the walk. I knew at once that it was Ella and the baritone. Mother had said when I objected to the child going alone, that he would bring her home.

I sat in the hammock. It was very thoughtful in Ella to bring him in. She knew that I had not seen him since my return,, and Mr. Smith and I had been once very good friends.

To my astonishment they did not come to the hammock, but sat down on the bench near the lilac bush. What could the child be thinking of? Had she forgotten me? Well, he would ask for me in a moment, any way, so I sat still and waited.

They did not say a word for several minutes and then he said very softly, "Ella." I started in amazement. What made him talk in that tone, and why didn't he call her Miss Westford? I felt indignant at the impertinence and wondered why Ella didn't resent it.

There was perfect silence for some time. Then the baritone said softly and gently, "Darling." My eyes flashed. Would Ella allow that ill-bred fellow to go on? She surely ought to know better. I was so excited that I did not hear what she said at all, but I knew it was not what she ought to have said, for when he spoke again it was in the same loving tone, though I could not hear his words.

Unmistakably it was a love affair. He had evidently talked so to her before. How perfectly ridiculous! Why, Ella was a mere child, only eighteen. I was years older, and no one had ever talked that way to me. What could mother be thinking about to allow such a thing? It must be that she did not know it. Well, I would see that it was stopped at once. That was my duty, of course. Ella must be sent to school. She ought to have been sent before.

The baritone, too! Why, he was years older than Ella. He was just about the right age for—he was older than I. He was a fine fellow, I used to think. Ella, indeed! He must be flirting with her. No, he could not be. He was too good for that.

My cheeks burned and my heart beat fast. How my head ached! Why didn't mother come? I leaned back in the hammock to compose myself.

"Sit closer, dear," said the baritone. "I want to talk to you."

Suddenly I realized what I was doing. I, Elizabeth Jane Westford, actually eaves-dropping. But what could I do? If I spoke they would know I had been listening all the time. I buried my head among the cushions and held my hands over my ears.

I was so miserable! And the tears were getting on the rose-colored cushion. Even in my distress I wondered if it would fade.

I had not noticed before how warm the evening was. At last I could endure the cushions no longer and sat up with my hands still over my ears. The moon had risen and I could see two people coming down the walk. They stopped at our gate. Was it—could it be—yes, it was Ella. "Mother," she called, "is that you under the lilac?" Then in a lower tone, "Yes, it is. Good night, Mr. Smith; thank you."

I dropped back dazed. Father and mother on the bench by the lilac! I had forgotten that mother's name is Ella. How lover-like they were! It was perfectly charming. I woudered why they were going in. The moonlight made the evening pleasanter than ever.

Then mother called to me that it was getting damp, and I was surprised when I gathered up my books to find that I was crying again. I did not know why, I am sure I was very happy.

That was early in the summer. I know father's voice better now—yes—and the baritone's too. He has a very fine voice. He says "darling" sometimes, as father does, too.

Ella is not going away to school this fall. She will finish her course in the high school first.

I am not going to teach, either. I—well—you see, Mr. Smith thinks I need more rest.—Business Woman's Magazine.

ENCOURAGE THE BOYS.

By. J. H. Worst, President of the North Dakota Agricultural College.

If you want your boy to be a farmer, give him an insight into the best side of farm life. Don't shut him out as a beast of burden. Hard work will do him good, provided there is a desirable end in view and in which he has a logical interest. Work that interests a boy loses the element of drudgery at once. He will work twice as hard and enjoy it. Enjoyable work is the same as play, for play is nothing but the exercise of enjoyable energy.

Encourage him to become a farmer. There will always be encouragement enough to take him away from the farm if he has a better talent for business or a profession. The great danger is that he will be inveigled into something else when nature intended him for agricultural pursuits. There is no higher or holier or more honorable profession than agriculture. There is noue that promises better average opportunities for success. There is no profession that requires more brains or candid thought. The farmer may have to blister his hands occasionally, but the professional man must blister his brains contiuually or make a failure of life. Many of them do both.

Give him a good education. Send him to the Agricultural College where he has access to those studies that have a direct bearing upon agriculture as well as those that will give him culture and refinement. In the end he will be proud of the farm and prepared to enjoy his work. His enjoyment will be so keen that his work will be play.

The work at the Agricultural College is not a preparation for life—but a part of life. He glides almost imperceptably from the one to the other. He continues to do things he began doing while in College. He will do them better and more naturally for having made them a part of his education. Having learned to do things he will be a positive factor in the industrial world—adding to instead of depleting its material resources. He will be a producer instead of a mere consumer of products.

A little encouragement now and a little good sense in handling the boy and you will be as proud of him as he will be of you. Give him a chance to make the most of himself and you will never regret it. The country is in need of men that develop from such boys.

If we would get along always with best results we should apply the Golden Rule to all the relationships and amenities of life.

A bag of hot sand relieves neuralgia.

REMEMBER THE WIFE.

When a farmer gets on in life, says Edward Walden in the Geyersville Gazette, and feels he has a competence, he turns his farm over to his sons or nephews, or rents it, and retires from active life, and takes it easy for the rest of his existence. This is as it should be, but what about the wife? When does she retire from her duties of caring for the household? Alas! that time never comes while she has health and strength. If there are daughters, they sometimes assume the cares of the house and sometimes they do not, and in any event they are likely to marry and leave home, so the burden falls on the wife as before.

When the master of the household is in a position to retire from labor, why shouldn't the mistress also retire from her cares and turn her work over to a hired person, and have leisure to enjoy life in her middle age? She would find plenty of enjoyment in taking up many pleasures which for lack of time she never had the opportunity to take advantage of before; in fact more pleasures await her leisure than are open to her husband, as he has always been in the busy world and has had variety in his life which was lacking in the home existence of his wife. Men should think of this, and as they relax the cares of life and take more leisure, let them remember the wife at home and see that she also has things easier and has time for the pleasures of life.

LEARNING.

The new cook was helping her mistress to prepare dinner, says the New York Times. All went well until the macaroni for the pudding was brought out. The cook looked with surprise as she beheld the long white sticks. But when they were carefully placed in water she gave a chocking gasp:

"Did you say, missus?" she said in an awed voice, "that you are going to make puddin' out of that?"

"Yes, Jane," was the reply, "that is what I intended to do. But you seem surprised. Have you never seen macaroni cooked before?"

"No, ma'am," answered the cook, "I ain't. The last place I was at we always used them things to light the gas with."

Cookery Recipes

Cream Walnuts.—Take the white of an egg, add to it an equal amount of cold water, and stir in confectioner's sugar until it is stiff enough to mold into shape with the fingers. Be sure to use confectioner's sugar. When the cream is of the right consistency, it does not stick to the hands. Add the flavor when stirring in the sugar. Mold into balls. Have ready English walnuts carefully divided into halves and place a half nut meat on each side of the ball, pressing it into the cream. Lay aside to harden.

* * *

Nut Creams.—Chop fine meats from pecan nuts or hickory nuts. Make a foundation cream as for cream walnuts and flavor with vanilla. The cream for this candy should be no thicker than cake batter. Mix thick with the nuts and drop from a spoon on oiled paper, leaving it rough on top. Other nuts may be used, or dessicated cocoanut. If the latter, make the cream still softer.

* * *

Chocolate Creams.—Make a foundation cream as for cream walnuts and flavor with vanilla. Mold into drops, and, holding them on the tip of a long sharp hat pin, dip them into dissolved sweet chocolate. Lay on oiled paper and set in cool place to harden.

* * *

Sultan Chocolates.—Make foundation as for cream walnuts. Have ready one cup grated chocolate (the unsweetened kind,) mix with ground cinnamon and cloves to taste. Add this mixture to the cream while it is soft, and then add sugar until it is hard enough to mold.

* * *

Pumpkin Pie or Custard.—Wash and dry the pumpkin, remove the seeds and soft inside, grate without peeling on a moderately fine grater and to each cup of the grated pumpkin add 1-2 cup sugar, one egg, well beaten, one tablespoon molasses, one teaspoon ginger, 1-2 teaspoon cinnamon, a pinch of salt, and one coffee cup rich milk. Line deep pie plates with rich crust, fill two-thirds full of the custard, and bake in a moderate oven for 1 1-2 hours. This mixture is also nice baked in custard cups.—A.

* * *

Mince Pies.—Three pounds round of beef, 1 beef tongue, 2 1-2 times as much coarsely chopped apple as there is chopped meat, 5 pounds sugar, 2 heaping teaspoons salt, juice and grated rind of 2 lemons, 2 quarts boiled cider, 1 pound butter, 1 heaping teaspoon each of ground cloves, allspice, mace and cinnamon, 2 grated nutmegs, 2 pounds currants, 2 pounds raisins, (seeded), 2 quarts canned peaches, and beef stock to moisten the meat. Mix thoroughly, adding cider or diluted lemon juice enough to make the meat considerably more moist than necessary when done, as it dries away in cooking. Place in the oven, cover and cook until tender, but no longer. Stir often while cooking. It will take an hour or two after it is thoroughly hot. About half an hour before the meat is done, add the peaches. These are not necessary, but they give a delicious flavor. Add a little butter and sugar when making up into pies. This is an ideal mince meat.—N. M. P., in Farm and Home.

* * *

Baked Eggs.—Break 8 eggs in a well-buttered dish, put in pepper and salt, bits of butter, and 3 tablespoons of cream, set in oven and bake about 20 minutes; serve hot.—Mrs. C. C.

* * *

Feather Cake.—One cup sugar, half cup sweet milk, one egg, one tablespoon butter, one cup flour, a pinch of salt, one teaspoon baking powder, flavor to taste. This is excellent.—Winnifred.

* * *

Mother's Corn Bread.—One teaspoon salt, one tablespoon sugar, one teacup sour milk; beat one egg and add to mixture, with one cup each of flour and corn meal, and a tablespoonful of lard or butter melted. Stir briskly before adding one teaspoonful of soda dissolved in hot water. Bake in a quick oven for fifteen or twenty minutes. Instead of the sugar, New Orleans molasses may be used, enough to slightly color the batter. It is much better to add the soda last, when making all hot breads.—Winnifred.

NO GREAT EFFORT THANKSGIVING.

Again our National Thanksgiving period is at hand, and the busy house wife will be engaded entertaining or being entertained. To the farmer these lines are suggested.

The farmer's wife is confronted by a somewhat different proposition from her city sister. The latter has delicacy stores to order from while the former must, in a general way, work out her own plans, prepare her own dinner and act as hostess in addition. Many a head will ache on Friday morning, the result of over work and nervous excitement occasioned by the strenuous endeavor to have a feast, and a jubilee beside . We wish it were possible to persuade every house wife, and especially those who do their work unaided, to entertain simply. We know this is hard, when for many years this day has been a day of lavish display and expenditure to say nothing of days of hard work and of sleepless nights for fear the dinner would not be a success. Then, too, we have such an endless variety of good things to select from. Nearly every country on the globe contributes something that tempts us. But would it not be more in keeping with the sentiment of the day to use only American products in preparing our Thanksgiving dinner?

We raise enough on our various ranches in California to furnish a sumptuous Thanksgiving dinner—the cranberry alone excepted. We can call on our poultry yard for fat turkeys, ducks or chickens. We can get vegetables to suit the occasion and we can, if we choose, eat our holiday meal under the graceful branches of the California pepper.

The trouble with our American women is, that when we come to a holiday dinner they over crowd the table. They prepare too sumptuously. A few well chosen and well cooked dishes are much to be preferred to a greater number carelessly selected and cooked. A turkey or chicken or duck, of course, we must have. It would not be Thanksgiving without it, but let this be the crowning dish. Have it well fattened and carefully roasted. With it serve cranberry sauce, and not more than three vegetables—one of these in the form of a salad. A dessert that may be made the day before, with fruit, nuts and confections, if you choose, complete the menu.

Pay a good deal of attention to the setting of the table. Make it plain, but tasty in appearance. Go out in the garden, gather a basket of roses, carnations, and vines, or go to the hills and bring down some evergreen ferns or holly berries, arrange the ferns flatly on the table forming a mat.

Place a basket in the center of the mat and fill with fruit. Arrange the leaves around the edge of the basket and let the vines trail over the fruit. Fasten a cluster of three fern fronds invisibly to each corner of the table and your table decorations are complete.

Serve the dishes hot, by all means let the fowl be hot, and also the vegetables and the coffee. Then when seated about the table, eat slowly, let the nervous strain go away with the meal, so that when the dinner is done there may be a feeling of rest, rather than of worry pervading the entire company.

Let joy and thankfulness abound, joy that we live and can make our friends happy; thankful that our country is at peace, our homes preserved, our families healthy and are blessed with the comforts which industry brings. Try these simple suggestions, readers of the Cultivator, and tell us by and by if you have not profited thereby.

THE WOMAN FARMER.

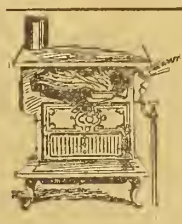
In these progressive times the handle of the agricultural tool is coming to know the grasp of the woman's hand almost as well as the needle or the broom, and many women are making reputations as farmers of progress. Among the agriculturists are wives, widows and maidens, women who have begun with small means and women of wealth who have entered the ranks for the pleasure they could get out of it, or for philanthropic purposes. One and all are bright, intelligent women, and the large majority are educated and cultured. Some are in partnership with men, others own and manage farms for themselves, while many manage farms for other people. Careful investigation shows that these women have distinguished themselves by their skill and executive ability.

In some important specialties, such as flower seed growing, poultry raising, fancy dairying, and the growing of raisins and nuts, they have been successful pioneers. Their farms are scattered all through the country, on the uplands and in the lowlands, among the valleys and even on the mountainsides. Some are cultivating their thousands of acres, using the steam engine as a plowman. The majority conduct farms of more than 100 acres, while a few are contented with a single acre, depending on the spade and hoe.

Women lead in poultry culture in which they began more than a decade ago and it has been an uphill struggle against prejudices. Few, it is said, make a failure of it, and the time, they claim, will soon come when women will control the industry here in America. It pays a greater interest on the investment than any other branch of farming.

A HOME MADE CEMENT.

A strong cement which may be used for mending stone jars, stopping leaks in kettles, to fasten in lamp tops and for all sorts of other purposes is made of glycerine and litharge, made to the consistency of thick cream. This cement will resist the action of hot and cold water and is well adapted for the mending of all sorts of things which are intended for use as well as for ornament, and therefore are supposed to be fit for hard ware. The one point to be remembered is that the cement takes a long time to dry. So after the repair has been made it is well to set the jar or whatever it may be away on a shelf for a week or more that the cement may become perfectly hard before it is used.—Farmers' Review.



BURN AIR AND SAVE FUEL

You can do it with the

HAGUE IMPROVED DOMESTIC OIL BURNER

It burns more air than any other burner on the market. Can be fitted to stoves, ranges, furnaces, and all kinds of heating systems. Simplest and most economical burner on the market. If you want the most heat for the least money, write for information to

Hague Domestic Oil Burner Co., 810 So. Spring St., Los Angeles, Cal.

DRIED PEAS—Prices per ctl: Niles, $1.75@2; Green, $1.75@2.25; Field, $1.50@2.

Live Stock.

Conditions throughout all departments of the Live Stock market are purely a reflection of the features thoroughly reviewed for some time past. Sheep continue in scant supply and rule strong at full quotations and A1 Steers and Lambs share second place interest at firmly held rates. Calves and Hogs are plentiful at the familiar prices.

CATTLE—No. 1 Steers, 6½@7; second quality, 5½@6c; third quality, 5@5½c; No. 1 Cows and Heifers 5@5¼c; second quality, 4½@5c; third quality, 4c; thin Cows and Heifers, 3@4c; Bulls and Stags, 2@3½c. Prices for all descriptions less 50 per cent shrinkage.

CALVES—Light, per lb, 4¼@4¾c, gross weight; medium, 3¾@4c; heavy, 3½c gross weight.

SHEEP—Per lb: Wethers, No. 1, 4¼@4¾c. gross weight; Ewes, No. 1, 3½@4c, gross weight.

LAMBS—Suckling, $2.75@3.25 per head or 4½@5c per lb., live weight.

HOGS—Per lb.: Hard grain fed, weighing alive 80 to 130 lbs., 5¼c; 130 to 250 lbs, 5½c; 250 to 350 lbs., 5¼c; rough heavy, 4@4¼c; common, 3½@4c.

Hops.

The price of desirable grades is nominal at 8@12c per lb, according to quality.

Hay and Cereals.

HAY—Per ton: Wheat, $11.50@16.50; Wheat and Oats, $11@15.50; Oats, $9@13.50; Barley, $8@11; Clover, $7@10; Alfalfa, $6.50@9.50; Stock, $5@7.

WHEAT, No. 1 Shipping, per ctl, $1.35@1.37½; inferior grades, $1.20@1.32½; White Milling, good to choice, $1.40@1.43¾; and $1.45 for fancy.

BARLEY—Choice No. 1 Feed, $1.17½@1.20; some fancy grades up to $1.21¼; common to fair, $1.15@1.16¾; inferior grades, $1.10@1.13¾; Shipping and Brewing, $1.23¾@1.27½;

OATS—Good to choice White, $1.38½@1.50; Red, 1.50@1.62½ for choice to fancy; $1.25@1.40 for common to fair; Black, for seed, $1.60@1.75; lower grades, $1.25@1.55.

CORN—Good to choice, per ctl: California, new, large Yellow, $1.32½@1.35; small, do, $1.55@1.65; Eastern Yellow, $1.37½@1.40; White, $1.32½; Mixed, $1.35.

RYE—New, $1.45@1.52½.

CITRUS MARKETS

Eastern orange markets are somewhat lower, with an over supply of green, sour fruit. Best navels are still arriving from Northern California. Shippers should hold their fruit until in better condition, as under ripe fruit is not wanted. Floridas are in fair supply, but will be cleaned up by January 1st. They command uniformly lower prices than California navels. Lemons are plentiful and slightly lower.

New York.

Three carloads each of lemons and navels offered Monday and all sold at good prices. Moore Estate navels from Exeter averaged $2.67 for ex fy, and $2.52 for ch, while Mariposa and Mistletoe brands brought from $2.76@3.05. Lemons—Independent, fy, Highland, $4.00; Corona Queen, Spence Ft. Co., Corona, $3.36; Silver, ex fy, Arlington Hts Ft. Co., Prenda, $4.27; Palm Tree, same, $3.05.

Three cars of navels sold Tuesday, all from Exeter. Mariposa, ex fy, Mrs. M. E. Newhall, $2.35@3.10; Moore Estate, ex fy, $2.40@3.35; same, ch, $2.35@3.15. Two cars of lemons sold as follows: Flower, ex fy, Claremont, $3.50@4.25; Squirrel, fy, Arlington Hts Ft Co., Prenda, $3.45@3.65.

Wednesday brought much green fruit and prices were easier. Moore Estate, fy, sold at $2.25@3.10. Lemons steady with easier demand on account of colder weather.

Chicago.

Oranges and lemons both quiet Monday. Lemons—300, $3.25@3.50; 210-240, $2.50@3; 420, $3.25@3.75; navels, $3.00.

Oranges arriving Tuesday rather green and sour and in over supply. Prices unchanged. Lemons weak at former quotations.

Wednesday brought more oranges than the demand could absorb.

Waite, Bailey & Lynch, buy, sell, exchange, repair and install gasoline and steam engines, boilers, air compressors, power pumps, etc. Otto gasoline engines, all sizes, to 200-H. P., better built, more economical, therefore superior to all others; prices and terms that will insure due consideration. 943-945 N. Main st., Los Angeles, Calif.

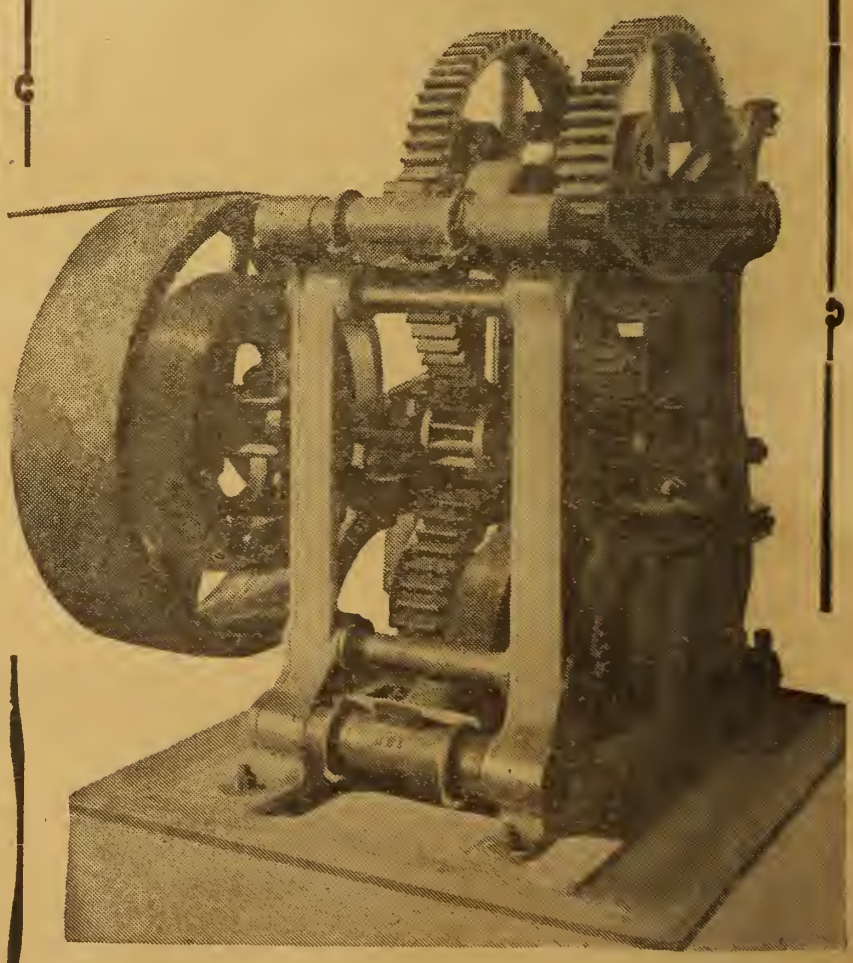
The Record for the New Pomona Pumps

FOR 1905

Not a Broken Rod, Not a Plunger Pulled for Repairs



The irrigation season just closing has demonstrated fully the high merit and efficiency of the New Pomona Pumps.

Every one installed has passed through the season's run without breaking a rod or requiring the valves to be pulled for repairs, proving conclusively that the ideal beam motion used by these pumps is more than has been claimed for it.

The slow, uniform motion upward and the quick, smooth down motion handles the rods without any jerk or jar, while the long lap of the plungers in passing the dead points, keeps the water column in continuous motion upward and a steady stream flowing from the discharge pipe.

They have passed through the experimental period and are built better than ever for next year.

The ideal pump for irrigation purposes. Send for catalog.

LOS ANGELES SAN FRANCISCO

DECEMBER 1, 1905

PROGRESS OF RECLAMATION WORK.

The work of the reclamation service in reclaiming the arid lands of the West is progressing rapidly.

In California and Arizona on the Yuma project alone, the land intended to be benefited will be 85,000 acres, which will cost $3,000,000, while the Klamath and Sacramento projects will embrace many thousand acres and cost many million dollars.

The total sum set aside for the eleven Western States, to the present, is $32,870,000 and the amount of land to be irrigated is 1,859,000 acres.

The average value of irrigated land in the United States is $47 per acre. This acreage therefore will add $87,373 000 to the taxable property of the United States in land values alone. According to the census report of 1900 the average annual income from irrigated land is $15 per acre: On this basis an income of $27,885,000 per annum will be added to the nation's wealth by the projects already approved.

Irrigation is the hope of the future in California, as in all the arid States of the West. With it the added millions of population will find abundant opportunity to amass wealth, and the government derive an immense revenue from the lands, mines and factories which the territory embraced in the reclamation project will produce.

Coulson's No. 3 Condition Powders

Keeps Fowls Healthy. Keeps the Hens Working. Changes Feed into Eggs.
You Exchange the Eggs for

$ $ $ $ $ $ $ $ $ $ $ $ $ $ $ $ $

INSTRUCTIONS

When you mix up the mash feed for the poultry, just stir in a handful of Coulson's No. 3, and soon all the hens will be singing, for it makes the feed taste good to them, it cleanses the liver, it makes the blood circulate, it reddens the combs, it strengthens the digestive organs and it INCREASES THE EGG PRODUCTION, for it goes right to the spot.

Egg Machines==Keep Them Working

You have chickens. Did you ever consider them as machines—machines that make eggs? Did you see in a recent Sunday paper where hens were made to lay SEVEN TIMES THEIR OWN WEIGHT in eggs in a year?

Now, every poultryman knows, or should know, the importance of having the fowls in good condition and in good working order. Hens that are protected in this way lay the most eggs during the winter months, besides they will lay eggs that will hatch STRONGER and HEALTHIERCHICKENS, therefore, It means future PROFITS and PROSPERITY. Your fowls should certainly be well fed and cared for during the Fall and Winter season, for every one wants eggs when eggs are high.

In the morning when you are mixing up the mash for the laying hens, just put in a handful or so of COULSON'S NO. 3 POULTRY POWDER, and see how lively it will make the hens, how their combs will brighten up, and how they will cackle. And Eggs! Why, a few days after you will be finding eggs all over the place—for COULSON'S NO. 3 POULTRY POWDER touches the spot and starts the magic flow.

Send for a small free sample of Coulson's No. 3 Condition Powder and also a circular telling you more about it. This COULSON'S NO. 3 CONDITION POWDER is prepared after our own PRIVATE FORMULA from especially selected ingredients, carefully and properly compounded, and the result is this powder is a GREAT HELP to the poultry.

"An ounce of prevention is worth a pound of cure," and a little of this No. 3 Condition Powder in the feed may save you many hens, and give you many more eggs. THE HENS NEED A TONIC to strengthen them. ONE CENT'S WORTH will do for twenty hens; one cupful, 5cWORTH, for one hundred laying hens. Get a package of this Coulson's No. 3 Powder; it will surely pay for itself.

The price is 15c per pound, but as a SPECIAL INDUCEMENT, and in order to convince you of its merits, we will send you 10 POUNDS FOR $1.50, EXPRESS PREPAID to your Station, or 25 pounds for $3.25. TRY IT; why not?

BEFORE

Increase of Intensive Farming in California

By Mrs. E. M. Stetson, Toluca

Notwithstanding all its great features of size and grandeur, the West is awakening to the modest worth of close economy in small farming. There was a day of sloth when all of these noble resources lay fallow, and man lived at his ease by the least exertion possible here. Then came the grand rush of hot-headed enthusiasts who left a wake of followers that could see nothing that was not enormous in undertaking. Fast enterprises were in their blood and fed by the streams of speculation in mining they hardly needed the fostering spirit of the topography and soil to energize them into activity.

The great forests of Oregon, Washington and Northern California when opened up for timber cutting brought out the desire for work on a large scale. The mountains of ore that lay in the Sierras and Coast Range, with the miles of placers lying in sections between, were stimulants to undertakings of great proportions; and the broad valleys of the water courses with thousands and thousands of acres of tillable land gave no rest to the imagination of the western farmer until he could get machinery large enough for its cultivation.

It was a sympathetic suggestion of nature to him, a suggestion like the strength of a great magnet, and he could no more settle down to a potato patch or small truck farming than an eagle can perch on a pea vine and peck at the ants and the lizards for a living.

Such a change as is now presented in the manner of farming and other kindred occupations would hardly seem possible here with all these fostering agencies still present still prolifically abundant. Yet the change has really begun, and though all evidences of the former stage of magnificent proportions are not removed, still the new era has received a strong impetus, a very strong impetus, from the fact that it is a pronounced financial success.

The reasons for the change are not found in nature, but in man. The introduction of large and complicated machinery for the cultivation of great areas of land limited the number of men available and called for those who were skilled in mechanics. Those rejected must farm on a small scale or move on to other countries.

The coming of a large number of men and women from the East with less majestic ideas, health seekers here for a time with no great expectation of wealth or income, only enough occupation to keep busy and live out of doors, these all brought the idea of small farming to the front, for they made a comfortable living on their small patches and in many cases, considerably more than a living.

These features in themselves could have never constituted a sufficient impetus to throw so large a number of the people on the west coast into a condition bordering on aboringine agriculture, had there not developed along with these features a large and extensive market for exportation as well as home consumption. As the country grew it called for more berries, lettuce and beans, and from the excellence and rapidity with which these were produced there was opened

Intensive Farming [illegible] in a San Joaquin Orchard.

a market for homes here and elsewhere. Thus Los Angeles now ships large quantities of fruits and vegetables to Arizona, New Mexico, Texas, and all throughout the great Southwest, besides calling for an ever increasing supply herself. Lettuce is trimmed, washed and packed with ice and sent to nearly all parts of the United States from this point. Grapes are now handled and those of table varieties are bringing in thousands of dollars per year to owners of but ten or fifteen acres.

There is in addition to all of these reasons for the change in the manner of farming another and possibly a stronger reason in the education of the people through the universities in scientific and intensive farming. The enthusiasm aroused in Iowa, Kansas and throughout the Middle and Eastern States generally by the adoption of university or college methods in farming and the pronounced success of the trials, has spread to the West, and efforts are now made to secure the best men for the colleges of agriculture here.

Not alone is the interest in the colleges and among men of naturally scientific mind who have turned their attention to farming, but also with the otherwise uneducated men who have heretofore sowed vast fields of hay and grain in an irresponsible and hit-and-miss fashion with a corresponding [illegible] for their labors. These people [illegible] grown tired [illegible] the heavy respon[illegible]s, with their niggardly returns and when seeing the results of small farms carefully attended are selling off and coming down to a one or a two man plantation.

The printing and distributing of bulletins of information on special subjects by the States and the Federal Government has opened up the way for learning and specialization. Farmers get word of these through their farm papers, send for them and read them thoroughly, read with a present day personal interest, read with intention to go and do likewise, and read with a view to do one thing at least especially well.

With small farms and thorough analysis of soil the average farmer can by selection of fertilizers increase the yield per acre not only ten but a thousand fold. One man in Southern California by means of fertilizing and proper irrigating took over a thousand dollars worth of strawberries from a single acre in one year's time.

Sulphates, muriates, nitrates, potash, bone meal, super phosphates, and simple phosphates, and many other terms of chemical quantities are common words of conversation now among the class of farmers that are endeavoring by using their brains to save their heels, to make every inch of ground yield up the greatest possible amount of commodity. The reaction of lime on acid soil, the diluting and diffusing of clayey constituents, when found in harmful quantities, into other forms of soil character that are valuable, these and many more interesting studies are the means of keeping the small tract ranch man an enthusiastic conjuror of his own territory, small though that territory may be.

Just what effect the bacteria culture of alfalfa, peas and other leguminous plants will have on the farming of the West it is at present difficult to say. The reports from experimenters in the filed are divergent in opinion as to the relative merits of the solution. Some say it has a wonderful effect in producing growth, especially of the green cellular structure; others are not so enthusiastic. If, under proper application, however, it could be brought to a scientifically satisfactory condition, there is no doubt but that it would place the small farmer upon a pinnacle of prosperity.

The earlier and more approved method of introducing nitrogen into the soil by planting Canadian peas, cow peas, or vetch, and when these have matured sufficiently for the little nodules on the root and stem to become filled with nitrogen then plow them under, has put many a shining gold piece into the pockets of the prospering experimenter. Orchards of oranges and other trees now show a long line of vegetation between the rows and fields of wheat and barley worn out by successive years of similar crop sowing, have been planted to Canadian or cow peas with prolific and abundant crops following thereafter.

All of these methods of soil improvement point to the successful operation of the small farmer. For though the

Berry Growing in Tulare

The following paper by Mrs. E. H. Gordon was read at the Farmers' Institute recently held at Dinuba.

* * *

Having invested in a piece of unimproved land, we looked around for something that would bring quick returns until the time the trees and vines should come into bearing. We noticed few berries grown hereabout, with the exception of the common blackberry, which has the unfortunate habit of sending up new plants enywhere within a radius of from one to ten feet, just where you don't want them. and in case you want to use the ground refuse to be gone. The more you cut them the more they come.

We decided to plant different sorts, giving the preference to the strawberry. We have found that this beautiful and delicious berry thrives best in the richest of soil. In fact, the three essentials in strawberry growing are good soil, good plants and plenty of moisture. There seems to be almost no limit to the amount of fertilizer that may be used with this berry. The land should be deeply plowed and thoroughly cultivated before the beds are made. After throwing up the beds the water should be turned in. It will settle the ground and is also the best surveyor, very quickly showing the unevenness of the beds. The beds should then be leveled to one inch above the waterline, after which they are ready for the plants.

This may all seem a great deal of work, but we have found that it pays to do it. The beds are about ten inches across the top, the plants being set on the outer edges. This plan saves space and water. Short beds are favorable and are watered in sections. Very shallow cultivation is needed.

Water is used according to the temperature. The plants are never allowed to get dry during the fruiting season. During the heated term, we use the water as much as possible in the cooler parts of the day. A light mulch of clean straw is placed under the plants and in the waterways, which serves the double purpose of keeping the berries clean and the conservation of the moisture.

Fall planting is growing in favor as in this way you are assured at least two good crops the following spring. All runners should be kept off, and the beds free from weeds. Rather close planting—from six to eight inches—gives good results in this warm climate. The market of the strawberry has been a very simple problem. The berries sell themselves on sight. The supply as yet has never equaled the demand. From the 2000 plants first set we gathered as many as 250 baskets of berries in a day, which retailed at 10 cents a basket.

The Logan berry and the Phenomenal raspberry, the last named being a cross between the improved dewberry and the cultivated raspberry, and described by Mr. Burbank as the largest berry ever grown. They should be set six or seven inches deep in well-prepared soil at least six feet apart, eight feet between the rows. Let them grow one year, watering often enough to keep them growing thriftily, and keeping them well cultivated. Set stakes 15 to 16 feet apart and stretch wire from stake to stake to tie the vines to, as they have a trailing habit and must be supported. Prune to about four feet in length. As soon as the vines are through bearing they can be cut out and the young vines that grow about the foot of the hill tied to the wire.

We are growing, also, three varieties of blackberries—all tip rooting—viz. the Mammoth, the Rathbarn and the Gardena dewberry, the last named being allowed to trail on the ground. These berries should have about the same care and cultivation as the others before described. These fruits have all done well and borne heavy crops and the only secret of our success is using plenty of fertilizer during the winter, cultivation and plenty of moisture.

From our experience with these fruits, we have demonstrated, on a small scale, the adaptability of the soil and climate of this great Alta district to the culture of these berries. With proper facilities for handling the crop, at the season of their heaviest bearing, there is no reason that this industry should not become a very profitable one. It would give pleasant employment to many men, women, boys and girls at a most agreeable season of the year and at a time when other work in other fruit is scarce.

PHYLLOXERA.

Professor Bioletti gave a most interesting and instructive lecture on phylloxera, that scourge of grapevines, which, when it has once got hold of vines cannot be cured and will inevitably kill the vines, though the period of activity varies from two to twelve years. In Fresno county, where phylloxera is known to exist, it has been present for ten years, though it was discovered only about five years ago. And irrigation and sub-irrigation in that county has retarded its advance The pylloxera is a very minute insect, but appears in groups, and so may be seen by the eye, especially the experienced eye. "Look for phylloxera in July and August," says Professor Bioletti, "at that time if it exists, it may be seen in powder-like blotches on the root about six inches below the surface of the ground. The insect sometimes takes wings and appears in the air, spreading thus from one vine or vineyard to another. But the presence of phylloxera may be detected by a glance over the vineyard. General yellowness does not indicate it. But a single sick looking or dead vine, surrounded by others of short growth, is a pretty certain sign, and at such symptoms the vineyardist should grub out the dead vine, the sickly ones and a circle of good ones three or four deep around the infected circle. And if phylloxera is not anywhere else in the district, it might pay to dig up and burn vines for an area of five acres.

This disease of the vine does not discolor the leaves. It simply shortens the growth of the canes. Professor Bioletti advises the grower who suspects the presence of phylloxera in his vineyard, to cut off a section of root about a quarter of an inch thick and send it to experts at the university or elsewhere for examination.

His exposition of the subject was of great value, and the same may be said of his advice as to pruning. As everybody knows, the object of pruning is to lessen the number of bunches of grapes so as to increase their excellence of quality. It would be impossible to give the details of his discourse; those who did not hear it missed a valuable opportunity. But as to pruning Thompson seedless, he advised that the spurs be left four or five feet long, and it was approved by local instances that the vines bear better when lying prone upon the ground than when staked upright, for in the latter position the sap goes to the extreme top, and in the former is evenly distributed. The time of pruning, he says, is a matter of choice, varying from two weeks after the leaves drop till two weeks before the buds again appear.

GREAT YIELD OF BANANAS.

A gentleman, who is a close observer, recently traveled over much of the state of Tabasco, Mexico, studying the agriculture of that region. He assures the New York Commercial that the account books of Senor Jose J. Duenas, of San Juan Beautista, shows that that millionaire planter harvested 31,200 bunches of bananas from 57 acres, during the twelve months next preceding that visit. This was equal to 547 bunches per acre.

The cost of cultivation, harvesting and delivering was $3120. If the fruit sold for the price paid in Cost Rica for bananas, 31 cents a bunch, the profit on the year's yield from those 57 acres was $6552, or $114.95 per acre.

That equalled 210 per cent on the cost of production, or 10 per cent more than the profit on the crops of seven banana plantations in Costa Rica for the year that ended with June, 1903.

The Los Angeles office of the Cultivator has been moved to 115 North Broadway, (upstairs.)

Spraying a Small Orchard
Requires a small spray pump—but a good one. You want just as good fruit as the owners of large orchards who use power sprayers—and you can have it. Any spray pump has done its part when it provides a high, even pressure, keeps the spraying material well stirred, gives no trouble, and works reasonably easy.
Bean's Little Giant Pump
does all this and more. When we say it "keeps the material well stirred" we mean it too, and it's important if you want good fruit. And the "no trouble" feature lets you feel good natured after the days spraying is over. The valves can't clog, the stuffing box can't leak (because there isn't any) and the pump is so simple it is a pleasure to use it. Of course we have good pumps cheaper but **Bean's Little Giant** is altogether the best barrel pump ever offered for spraying small acreage. Also a splendid whitewasher

Write for our special offer, freight prepaid, and we will also send our illustrated Catalogue No. 16 describing ten sizes of hand pumps and telling what sprays to use and how to prepare them. State number of acres and kind of fruit. Write today.
Catalogue No. 18 describes "Power Sprayers."
Bean Spray Pump Company,

FERTILIZERS AND FERTILIZING.

An address before the San Jose Farmers' Club by Blayney E. Maynard of Mountain View.

Mr. Maynard set out by stating that there were three fertilizing ingredients —potash, phosphoric acid and nitrogen (or ammonia). Germany, he said has been leading the world in fertilizing experiments. The German is a great scientist, though when he comes here he falls into California ways of robbing the soil.

The speaker here quoted from an article dealing with the work of fertilization in Germany. The United States Consul in Berlin sounded a note of warning, which it would be well to take note of. He reminds us that many of the nations which have passed the zenith of prosperity have drifted back for lack of attention to the conditions which made for vigor. Mr. Maynard reminded his hearers of the fact that the soil which in years gone by could produce 40 to 60 bushels of wheat will now not produce 1 bushels and some soils none at all.

Having related what artificial fertilizing had done for Germany, Mr. Maynard said that in building up the soil it is an expensive process. A single application will not be sufficient. Only years of careful work will restore the soil to its original vigor. If the orchardists had taken up the matter 10, 15 or 20 years ago the desired result might be accomplished more easily and less expensively. He believed he was correct in saying that many California farmers were disgusted and some of them impoverished because the soil did not give the return for the amount of labor expended. Potash and phosphoric acid, if used in excess, will do no injury. He pointed to the success of chemical fertilizing as applied in Mr. Gieger's famous cherry orchard in West Willows. He recommended the use of potash to prevent potato blight. If potatoes are too mealy or break up too much in the boiling, a complaint very often heard from the kitchen, the potash test would probably overcome that difficulty.

Up at Saratoga five or six years ago a certain orchardist started to use pure bone meal. The orchard was in bad condition. It was an old orchard completely worn out. Today he has a splendid orchard in prime health and vigor. He has not been able to irrigate but he is a much more successful farmer since he used fertilizers. He takes more interest in his place and attends to pruning, etc., with greater care and regularity. In eight years this farmer has spent about $40 for fertilizers per acre—that is amout $5 per year per acre.

Dealing with the shrinkage of prunes, Mr. Maynard said that weather conditions had a good deal to do with it, also excessive water, irrigating too late, deficiency of water. Some think that if they pump water into their prunes they have to pump it out when drying. Water does not create heavy shrinkage unless it is overdone.

Of raw bone, he said that plants feed more readily from the nitrogen in the raw bone than from the phosphoric acid.

In this state Thomas' phosphate does not seem to have any effect. It does not go down deep enough in our orchards. He could not recommend it greatly, though in a few cases cited it had gained the desired effect. They should not expect any results from Thomas' phosphate the first year. from some fertilizers they may expect good effects the first year. In four out of five or nine out of ten orchards where fertilizers were used last winter the effect is noticeable now. In orchards generally the trouble is to get fertilizers down deep enough.

Nitrate should be applied before irrigating. It is a very hard matter to wash it out of the ground. Nitrate of soda can be applied to a lawn at any time and also to young trees.

RECLAIMING THE DESERT.

The history of irrigation is one of steady growth and development, as statistics of the past thirteen years show that a crop producing area larger than the combined area of Massachusetts and Connecticut has been developed in a region once the most forbidding in our continent. The remotest and most unsettled parts of our great country, except in Oregon, are being connected by railroads carrying the commerce of the world. The experienced irrigators of today evince far greater practicability and a readier adaptibility to the conditions of their environment than did the pioneers. Their labors are less severe and their achievements greater than those of their predecessors, because they have learned how to subdue and apply the forces of nature through innumerable inventions. Great problems of water storage and diversion have been worked out to practical conclusion. Every available stream is now a potent force for good. The dams, which impound the floods, also furnish abundant electric power for all purposes, and even the flow of the canals turns wheels which lift large quantities of water to fields above the line of gravity supply. With the development of irrigation the range supports larger herds and flocks, while in more than one district the irrigation ditches have made possible the development of great mines; cities, populous and prosperous, have risen in the desert and have attained commercial and mercantile greatness.—E. T. Perkins in Sunset Magazine for November.

SPRAYING TO KILL WEEDS.

In Ontario, Canada, early in July, weed patches in which 28 species and 12 botanical families of plants were represented were sprayed with a solution of 9 pounds of bluestone to 45 gallons of water. It was observed that 24 hours after spraying the effects were the same as 6 hours after the treatment. It is concluded that wild mustard is the only weed than can be destroyed by spraying with this solution. The flowers of field bindweed and white cockle, and the leaves of blue weed, bull thistle, Canada thistle, and sow thistle proved very sensitive to the spray.

GRAPES draw large quantities of POTASH from the soil. This must be replaced in the fertilizer, else the vine cannot thrive.

Interesting pictures of grape vines, grown with and without POTASH, are shown in "Plant Food," one of a number of valuable books for the farmer, which we send free for the asking. Send name and address.

BY J. W. MILLS, POMONA, CAL.

HOW I MAKE OLIVE GROWING PAY.

Mrs. Freda Ehmann.

The olive industry in the State of California may rightly be termed one of the most important of the many which this State has developed. Since the first trees were brought over from Spain by the Mission Fathers and were planted in the southern part of the State, olive culture has traveled successfully to the northern part of the State and is today found as far north as Tehama county, 300 miles above San Francisco.

I wish to call attention to a mistake which is so often made by taking it for granted that the olive tree will grow anywhere and under any conditions. Experience has shown that the tree may grow, but the grower must not be surprised to find a small and undeveloped fruit as a result of poor soil and lack of irrigation and cultivation. Olive trees are planted 60 to the acre, and if large trees of good stock, say four years old, are planted, they will yield a good crop in five years. From smaller cuttings, however, you cannot expect a crop under seven years. It has been the writer's experience that wherever olive culture has not been a success, it was because of local conditions or lack of attention and special knowledge.

As it requires skill and experience to prepare the commercial olive by pickling, it is necessary for the grower to be located near a general pickling plant so as to dispose of the crop advantageously, in case one cannot or does not feel disposed to do one's own pickling. The demand for raw olives is constantly increasing, while the prices paid are from $40 to $75 per ton delivered at the factory. It can be readily seen that this is a lucrative branch of horticulture. When we consider that California is the only State in the Union where olives are grown successfully, it may be easily understood what an extensive market there is open for California olives and olive oil.

I would, however, advise the planting of the large Mission variety only. My varied experience with all varieties authorizes this statement. Other varieties may have large fruit, but are not as desirable for the purposes of pickling as the Mission olive, nor are the trees and the fruit as hardy, and oil from the Mission olive is considered by the trade to be the best and brings the highest price in the market. In former years the Redding picholine was considered the best olive for oil, and was largely planted for that purpose, but by my advice to some of the growers, their trees of this variety have been grafted over to the Mission variety with the best of results. I may say the same of the Rubrias and other fancy varieties which are selected and planted from the catalogue without experience and knowledge of their commercial value both for pickles and for olive oil, and this, I might add, has been in a great measure the cause of some disappointment and dissatisfaction to olive growers.

At the present time packers should encourage the olive industry in California by paying the best possible price for olives, delivered or on the trees, as the acreage is not nearly sufficient to satisfy the demand of one large concern alone. The land in Yuba, Butte and Yolo counties is especially adapted to this industry and as the harvest of the olives comes at a time when the other farm work is over, there is ample time to give this fruit proper care in marketing it. Cheap land, plentiful water, favorable climatic conditions and a ready market combine to make California the best place on earth for the successful propagation of olives.

Any woman who feels inclined to pickle and prepare her own olives for the market, will always find ready sale for the California ripe olive, but I wish to repeat that by furnishing a poor olive to the trade, the reputation of the California ripe olive is thereby exceedingly endangered. I have found in my own experience that the Eastern people who know and recognize a fine, well flavored California ripe olive, are ready and willing to buy, but when a poor olive has been placed upon the market, it is impossible to get these parties to give the California ripe olive another trial.

Within the last five years, California olive oil has come to the front and is today recognized as the best of the olive oils on the market. While the margin on pure olive oil is not as large as it deserves to be, there are still encouraging results which invite the grower to increase her acreage as the making of oil uses all the small olives which otherwise would be rejected as pickles on account of their size.

In conclusion I would urge in the interest of the California olive industry the planting of the large Mission variety only, if you have good soil and ready irrigation facilities and treat your olive orchard as you would any other orchard, namely, fertilize and cultivate carefully, you will find that your efforts will be amply repaid. If you do prepare your own fruit and make olive oil from your own olives, make it a rule to furnish the very best as this will help to benefit this important industry and in the end assure you a better financial return.

THE BEST WINE GRAPES.

Hood Brothers near Kellogg in Sonoma county, have, in the course of three decades experimented with a hundred varieties of wine and table grapes. Next spring they will plant about fifty acres of new ground which will be divided among the following tested choice early ripening wine grapes.

a—Black Burgundy, small berry, makes a rich wine, regular bearer, average three tons to the acre.

b—Cabernet Franc, ripens evenly, compact bunches, four tons to the acre.

c—Cabernet Sauvignan.

d—Sauvignan Vert, a profuse bearer, yielding 12 tons per acre last year. Prune stump at two feet and leave four canes. It makes a fair light sauterne rather lacking in character, but excellent for blending.

e—Simillin Blanc, very hardy white grape, no mildew, scale, or sunburn, last to be effected by phylloxera, average crop five or six tons, rather too much character, excellent blend with Sauvignan Vert for making Sauterne.

f—Mondense, large black bunches with shoulders, four tons per acre, a heavy body claret.

These varieties will be grafted to approved resistants, set 6x12, with vinifera set between to be removed when those on resistants need the ground.

Some 2000 Lenoirs set out 16 years ago, when the grasshoppers were so bad, bear a box to the vine and seem to be at home in Knight's valley or on the light hill land.

Mataro wine looks well, but is light seen through glass, lacking in the desired ruby color. Needs blending with the Petit Bouschet. Neither do well here. With the exception of the Mondense which matures about October 1, the above approved varieties ripen early in September.—Sonoma County Farmer.

THE VALUE OF QUALITY

When you are considering the purchase of a wagon, buggy, harness, farm or dairy implement, always bear in mind that we have what you want and of the very best quality at the right price.

DON'T THINK

that you save any money in buying an inferior article. A poor wagon will cost nearly as much as a good one and the repairs necessary to keep it in good running order are very expensive.

BUY THE BEST

and you will be better satisfied and have longer wear at less expense than in the purchase of a cheap, thrown-together trap. We carry only such goods as we can recommend to be of first-class construction.

OUR POLICY

of giving full value has been adhered to since beginning business nineteen years ago. We have constantly increased our stock and now have a complete line to offer our customers.

CALL AND SEE US

when you are in Los Angeles. We shall be glad to show you the class of goods we carry. Our ad in last week's Cultivator, page 485, will give you a general idea of what we have.

NEWELL MATHEWS CO.,
200-204 No. Los Angeles St.
Los Angeles, California

TREES

CALIMYRNA FIG

There are a great many sorts of Smyrna Figs. We catalogue six kinds, but these do not comprise our entire collection. There is only one variety, however, which five years production on a commercial scale warrants us in recommending it for drying purposes, and this particular variety we have designated as above to give it the distinction it deserves. When you buy your trees from us, you know you are purchasing stock originating from pedigreed trees, which have been producing the highest grade of fruit for a period of years. When you purchase a thousand peach trees, you usually designate what you want. You certainly would not permit your nurseryman to send you a lot of varieties, without labeling them, if you could help it. Well, it is the same with the Smyrna fig, some are early, others late, some are purple, others green. Can you afford for the sake of saving a few cents to take chances on buying trees, which cannot be relied on. We were the first ones to demonstrate the value of this fig, and with our seal we guarantee the genuineness of our trees. Prices lower than ever before.

FRUIT TREES

Are grown on a deep, alluvial river bottom, virgin soil, consequently the root system is as perfect as good soil can make them. Our assortment of apples, pears, peaches, prunes, apricots is more complete than ever.

ORANGES AND LEMONS

Our stock is grown in Exeter, the famous thermal belt of Tulare County. The soil is a rich, deep, black loam, just the kind which develops the highest grade of fruit, as well as the most perfect type of tree. Our assortment consists of all standard varieties of Oranges, Lemons, Pomelos, Citrons, Limes, etc. Carrying out the lines already established in the other branches, we do not confine ourselves to one or two standards and no more, for although it costs money to keep up a stock of many varieties, we want to be on top in this, as well as in everything we specialize in the nursery business.

GRAPE VINES

If you do not know it, you ought to know that we are the largest growers of vines on the Pacific Coast. We are not only growers of raisin, wine and table grapes, but we are also making a specialty of vines grafted on Phylloxera resistant roots. Our great and enterprising neighbor, Mexico, is having its vineyards devastated by this pest, and we have already sold two orders to prominent vineyardists there, who know what our stock is, consisting of eighty thousand grafted vines. How did we get such orders? Because we had pleased our customers before, so they had no hesitation in patronizing us again.

ORNAMENTAL STOCK

Our stock of Texas Umbrella trees branched in all sizes, guaranteed absolutely true to name, is better than ever. We are extensive growers of Poplars, Mulberries, Maples, and all deciduous ornamental trees suited to our conditions.

In evergreens, we have Acacias, Eucalyptus, Palms, Roses, Greenhouse plants, in fact everything you want for your garden.

OUR NURSERIES

Eleven hundred acres in four distinct places. Expensive to run a business so widely distributed. We know it. Why do we not concentrate all in one place? Because we want to be in the position to grow the best of everything, and to do this, must select the soil to suit the tree, shrub or vine. No use to grow a tree where you know beforehand the conditions are not favorable for its perfect development. That is what twenty-one years of experience does. It places us in the position to grow the very best stock. In making a plea for your trade, we do so, not because we have the cheapest stock, but on the ground that when you favor us with your business, you will get the best which money, brains and experience combined can grow.

CATALOGUE

We will mail our large profusely illustrated Catalogue, English or Spanish, to any address on receipt of 5c postage. Price-list mailed on application.

PAID-UP CAPITAL, $200,000.00.

CITRUS FRUITS

FIGHTING SCALE PESTS.

The following letter to Thos. Stone, of Pasadena, by James Mills of Riverside is one of most unusual interest and value to all citrus orchardists. Occupying, as Mr. Mills does, the unique position of handling a larger acreage of citrus orchards than any other man in the State, his opinions and experiences are eagerly sought for by all growers, for most unusual success has followed his efforts to bring the orchards of the Arlington Heights Fruit Company up to a high standard both in regard to physical condition and financial returns:

"I beg to acknowledge receipt of your favor under date November 16. You interest me very much, particularly beacuse you are approaching this matter in the right spirit. Some damage has been done with the use of distillate spray, is being done, will be done, the like is true of the fumigating process. There are those who damage their trees needlessly. Since taking charge of this large tract of citrus groves, I have been spraying for black scale and also for red scale. We have not succeeded as well as we should like with the red scale but we have accomplished as much as some with the fumigation and at one-fifth the cost. We have, however, accomplished a very great deal so far as the black scale pest is concerned; we have practically exterminated this pest in some of our orchards. In some of these orchards three years ago the trees were covered with the black scale, so much so that they could not bear fruit. By the use of distillate spray we have entirely eradicated the pest, have re established the trees and they have borne immense crops. When I say that we have only washed 200 boxes of navels last year out of 160,000 picked, I say a great deal for distillate spray, yet the fact still remains that some of our neighbors have actually damaged their trees with the same process. Why? Simply because they hire the contractor to do the work and pay him so much per gallon. I would not let a contractor spray our trees if he did it for nothing. He has not that interest in the work that the owner must necessarily have. He does not take the precaution needed and many precautions must be taken whether we spray or fumigate. It is necessary that your orchard should be in prime condition. It is necessery that the irrigation should first be done and should immediately precede the spraying operations. It is necessary that the orchard should have been irrigated and that the land should be thoroughly moist and not dry. I have seen contractors go into an orchard long after irrigation, needing irrigation at the time, with the trees wilting and an electrical storm blowing and turn on the stream at so much per gallon. It is annoying; it is exasperating to know that there are growers of citrus fruits who are so little alive to their own interests. It is hard for me to tell you just what we have done, you must see our groves to realize it. I have sprayed groves for neighbors who formerly fumigated and they are immensely pleased. First, because the work was well done and second because it was cheaply done. I doubt very much if anybody could show me to day a particle of damage in any of the groves treated by us this year and we have covered six or seven hundred acres. We irrigate everything just prior to spraying. We run a large outfit and have two expert men in charge; one in charge of the machines to see that everything is in first class condition, the other overseeing the men to see that they do the work as contracted for. We test every drum of oil received and those shipping to us know that we test it. We are using less material, that is, of the emulsion this year than we did heretofore and with good results. It is not costing us much less than heretofore but the results are better. This is because of the expert supervision. If the growers cannot band together and consolidate their interest but must hire others to look after his work, damage must be expected. I do not quite understand why your grove is so filthy with scale as you say after repeated treatments. We expect to practically clean up the scale in one application. We treated a grove of 200 acres this year although it had very little scale on it and yet it is two and a half years since it was treated before. We treated it now because we prefer not to let the scale get control. If there are a few infested trees in an orchard we will treat the whole orchard.

With reference to the trouble you have in reaching the scale in your vicinity, one of your commissioners explained to me that the hatch was very irrigular near the coast. This must be the explanation of your trouble. With us the hatch is pretty uniform and we can wait usually until there is an almost complete hatch before beginning to spray. With our large acreage, of course we begin before the entire hatch is out, else we could not cover so great an acreage during the season. When we do this, however, we come back in the fall and treat the groves which we treated early, again. I believe that if you would treat your groves, say in April, and get all of the of the young hatch and again in October, that you could get the entire hatch and thus avoid having to spray your orchards every year. This year we have used 1 1-2 per cent. of distillate and 1-4 per cent. of turpentine, that is, three gallons of distillate and one-half gallon of turpentine to every 200 gallons of water. For a time we used just one quart of turpentine but we find it better to use one-half gallon of turpentine and less than two per cent. of distillate and then use ten gallons of the emulsion to the tree where formerly we used 18 gallons. Our small trees have cost us from three cents to five cents and our largest trees from five cents to six cents. The most expensive work we did this year was on red scale and the application cost just about nine cents per tree for large lemon trees. I see no reason why anybody studying the question and taking the necessary precautions, should be damaged. I took charge of these large groves when they were a by-word and a setnch in the nostrils of the community. They are now the pride of the community and I think of the state, and are paying their owners magnificently, yet this increase in value and productivness have been brought about at the same time that we were spraying to kill off the very large amount of black scale that had taken possession of many of the orchards. Whatever we may do in the future regarding red scale, we will continue to spray for black scale unless something very different happens to what has already happened. We will certainly not continue a practice that may be shown to have injured our trees, however cheap the process may be. We are in the orchard business to stay and we are going to use those methods which will conduce to the highest productiveness of the orchards and the greatest return in actual dividends to the owners. Red scale has increased on us in the lemons. It increased very rapidly under fumigation by the plat, from 500 to 5000 trees on one large grove of lemons in two years. We sprayed last year a portion of this acreage and fumigated the other. We got, we thought, about 91 per cent. with the spray and 99 per cent. with the fumigation, yet the scale has largely increased during the year and it is necessary again to both fumigate and spray. The grove that was fumigated is as bad as the grove that was sprayed, and yet we sprayed it in the interim besides. We will spray again shortly to kill off any scale that is now hatching and that is get-at-able but if there should appear a further increase next spring, we will buy our own outfit of fumigation tents and tackle the problem that way. I have not been able to see any groves in California and I have searched for them, where the red scale has been effectually stamped out by either process. I have letters from parties who claim to have fumigated for 12 years in San Bernardino County, at Ontario and at Uplands; one fumigated 6 times the entire orchard and 6 times by the plat and he says: I quote it—"All I can say is, my orchard is no worse." I have been trying to succeed without resorting to fumigating because the expense is very great. When, as I have told you in this letter, I am spraying our company's groves at from 3 to 8 cents per tree, the average not ruinning over 5½ cents, you will readily understand why I do not want to fumigate unless compelled to do so. I am satisfied that I will not be compelled to do so in this orchard so far as black scale is concerned. I am not satisfied as to the red scale. This red scale pest is a persistent one; it is hard to overcome and particularly so in lemon orchards because there we pick at least eighteen times per year and thus scatter it. One thing is sure, neither cyanide or distillate will kill the black scale under the shell. It has got to be hatched out, and at least not advanced beyond the "H" stage. You can not get at the egg under the old shell. You may fumigate and if the little pest is not out, you can not get him. Come and see us, see what we are doing; see that we have not killed any trees and are not likely to kill any. Nevertheless, I say again that there are many damaging their trees or having them damaged for them and they do not deserve much sympathy. If men will not study to their own advantage, the methods to be pursued for the protection of their property, they must, necessarily, be the losers. Fumigation is a good process; it costs considerable money. Last year we spent about $10,000 in spraying 194,000 trees for ourselves and other people; had we fumigated it would have cost us pretty near six times as much. $50,000 is not picked up on the street every day, not even at Gold Field or Cripple Creek. If we can save it we are going to do it and we are going to study to do it. $50,000 will pay 5 per cent. dividend on—figure it out for yourself. Yours truly, James Mills.

EVERY FARMER KNOWS

that it is necessary to use fertilizers; the only question is as to the meth dof applying them to the soil.

THERE IS NO QUESTION

in the minds of those who have ever used the **Buckeye Fertilizer Drill** that it is absolutely the best for the purpose. Especially adapted for use in Orange Groves. It puts the fertilizer where it will do the most good, saving time, money and labor We also have the **Buckeye Grain Drills**—nothing better on earth. Write to us or call at our new store.

WE ALSO SELL

the **John Deere Plows and Harrows.** Better than ever.

TROPICAL FRUITS.

The following list of tropical fruits suitable for growing in the most favorable sections of California were exhibited at the late flower show in Los Angeles in competition for "The Times" cup, offered for the best collection of economic tropical plants.

Aberia Caffra, "Kal Apple" capital for hedges, fruit edible. Natal.

Achras Sapota, 'Zapote Chico" yields best chewing gum, fruits very good. Mexico.

Aleurites cordata, yields "Wood-Oil" or Chinese varnish, from Southern China.

Aleurites Moluccana, "Candle-nut Tree" fruiting branch from a tree ten years old, began to bear at 5 years. Moluccas and Philippines.

Anona Cherimolia, "Cirimoya," well-known fruit, from Peru.

Anona macrocarpa, bearing more freely and larger fruits, leaves also larger, a distinct species. South America.

Anona reniformis, "Custard Apple," leaves smaller, flowers more powerfully scented; fruits kidney shaped. South America.

Alpine nutans, yields true "Chinese Ginger." Also quite ornamental. China.

Ananas stavia, ordinary "Pineapple," from tropical America.

Andropogon schoenanthus, "Lemon Grass," yields citronnelle oil. India.

Agathis orientalis, handsome large tree, yields true "Damar Resin." India and Malaya.

Benthamia fragifera, "Strawberry Tree" from northern India.

Camellia Thea, ordinary "Tea," from China and Japan.

Carissa grandiflora, "Natal Plum," also very ornamental. Natal.

Carissa edulis, fruits much prized for jellies. Arabia and northern India.

Casimiroa edulis, "Zapote Blanco," fruit much prized in Mexico.

Cinnamomum Camphora, well known "Camphor Tree," from Formosa and Japan.

Coffea Arabica, true "Coffee," originally from Harrar, Abyssinia.

Crescentia alata, "Tecomate," hard shelled fruits fruits used for cups, pulp medicinal. Mexico.

Cecropia peltata, "Trumpet Tree," hollow stems used for musical instruments, yields good fiber, fruits edible. Tropical America.

Cecropia palmata, similar to the above, but hardier, coming from Argentina.

Curcuma angustifolia, yields East Indian "Arrowroot." India.

Cupania sapida, "Akee fruit," brought by the negroes from tropical Africa to the West Indies.

Cedrela odorata, "Cuba or Spanish Cedar Wood," Cuba and West Indies

Cedrela fissilis, hardier and growing much faster, Paraguay and Brazil.

Cedrela Sinensis, excellent timber and shade tree, from China.

Dendrocalamus strictus, "Male Bamboo," solid canes, esteemed the best. India.

Erythrina suberosa, wood very light, used instead of "cork." India.

Eugenia Jambos, "Rose Apple," well known fruit, India and Malaya.

Eugenia Pitanga, "Surinam Cherry," first rate for dessert and jellies. Brazil.

Ficus Bengalensis, true "Banyan Tree," bark, leaves and roots medicinal. India.

Ficus elastica, the original "Rubber Tree," from which only rubber was obtained at first. Northern India and Assam.

Ficus Palmeri, very large tree, white figs, Sonora and Lower California.

Ficus Psuedo-carica, new, bears excellent red figs, from Abyssinia.

Ficus Sycomorus, wood much prized, fruits edible figs. Egypt.

Ficus saplda, glossy foliage, very fine fruits, Costa Rica.

Feijoa Sellowiana, large, egg-shaped highly perfumed fruit, sure to become very popular in California, from Uruguay.

Hibiscus elatus, tall tree, yields much prized "Cuba Bast," from Cuba.

Inga Feuillei, "Pacay," bears sweet, white pods much prized in Peru.

Inga dulcis, "Guamuchil" also with edible pods, from Mexico.

Lawsonia alba, yields "Henne Dye," flowers very fragrant, India, etc.

Lucuma mammosa, "Marmalade Fruit," very large, and fine taste. Tropical.

Musa paradisiaca, the well known common "Banana." America.

Nephelium longanum, the "Longan," a very pleasant fruit, South China.

Ocimum sanctum, "Tree Basil," used as we do "Sweet Basil" india.

Passiflora dulcis, "Grenadilla," well known edible Passion Flower. South America.

Passiflora laurifolia, "Water Lemon" much prized in the West Indies.

Persea gratissima, "Ahuacate" or "Alligator Pear," from Mexico.

Pilocarpus pennatifolius, yields "Jaborandi," the most powerful soporific known, from Brazil.

Pilocarpus racemosus, said to contain a higher percentage of the above. Colombia.

Piper nigrum, true "Black Pepper," Java and Moluccas.

Psidium araca, probably the best of introduced Guavas, from Brazil.

Psidium Molle, "Guava," with downy leaves, fruits rather sour, Central America.

Psidium Cattleyanum, ordinary "Strawberry Guava," from Brazil.

Psidium pryiferum, ordinary "Lemon Guava," from South America.

Psidium Friederichstalianum, new, blackish fruits, Central America.

Quercus incana, "Silvery-leaved Oak," with edible acorns, from India.

Quillaya Saponaria, yields "Soap Root" or "Bois de Panama," Chile.

Randia Thurberi, "Papache" fruits, much prized in N. W. Mexico.

Phyllanthus emblica, emblic or Myrobolan Tree," much used for jellies, as well as in medicine. India.

Phytelephas macrocarpa, true "Ivory Nut Palm," from Peru.

Royena lucida, yields a kind of "Ebony." Cape of Good Hope.

Sapium sebiferum, true "Tallow Tree," Southern China.

Santalum album, yields the true "Sandal Wood," of India.

Sapindus utilis, "Soap Berry Tree," from Southern China.

Tamarindus Indica, fine shade tree, subacid pulp of pods much used for refreshing beverages. India.

Vanilla planifolia, true "Vanilla," of commerce. Tropical Mexico.

A COMMON ERROR.

A prevailing error, in planting lawns, is that of selecting trees of the largest growth, which soon become a serious evil, and one which is not easily remedied except by their entire removal, which is sometimes, though reluctantly done. Ornamental grounds depend quite as much for their beauty on the stretch of unobstructed grassy lawn as upon trees and shrubs. The skillful combination of trees and grass forms the art of landscape gardening, so far as planting is concerned; and no small part of this art consists in the selection of trees which, both in form and size of growth, are best adapted to the size and disposition of the grounds to be ornamented.

SEA BEANS.

These highly polished seeds are sold as curiosities. Tourists bring them home, sometimes considering them the product of the sea. They are washed ashore by storms, and are collected and polished with emery, file and glass and are almost as smooth and bright as agates. The real history of the large, hard, bright oval "sea bean" is that it is the product of a vine, Mucuna urens, that grows in the West Indian islands, and tropical America.

The beans are double convex and of a rich chestnut brown, with a yellowish margin where the two convex surfaces join. These beans will keep as long as ivory, and are sometimes mounted in gold or silver as souvenirs and ornaments. They come to our shores on the ocean wave, but are not marine plants.

CARE OF POT PLANTS.

Turn your plants in the window to prevent them from becoming one-sided. Do this at least once a week. Keep them perfectly clean at all times. If cleanliness is next to godliness among men and women, it is next to healthfulness among plants. Indeed, plant health is largely dependent on it. Leave decaying foliage on a plant, and let dust clog the pores of it, and vermin breed at will, and in a short time you will have a plant hospital to run. Stir the soil to prevent it becoming crusted over. If the pots show green mold on the outside, scour it off promptly, and examine into the condition of the dralnage. If this is what it ought to be, few pots will become moldy.

Petunias stand the sun well and make very desirable bedding plants for California. The improved strains are very handsome and should not be overlooked when allotting space in your garden.

The Los Angeles office of the Cultivator has been moved to 115 North Broadway, (upstairs.)

Armstrong Nurseries
Field Grown Roses
Now is the accepted time to furnish your grounds with a few choice Roses, for which we are headquarters in California. Our new catalogue describes at length over one hundred varieties and contains many choice illustrations of the more popular sorts. Send 2c stamp for a copy.

In the Vegetable Garden

COMBINATION OF FLOWER AND VEGETABLE GARDEN.

It is not always easy or possible to have anything like a flower garden. Perhaps there is no space for it or not plants enough to make any show. In this case, combine the two—the flowers and the vegetables. The latter are, of course, the more important of the two. Flowers are very pretty, but nice crisp lettuce, carrots, parsley, onions and all other kinds of vegetables are of a great deal more importance than flowers. We can get along without flowers; we must have the other things; and by having the two in the same spot, one adds interest to the other. A particular section can be set apart for the flowers if you choose, but that is not, after all, necessary. Only a little regard should be had to keep together plants of the same height, as that will be better than having very tall plants too close to small ones. But in a bed three or four feet wide roses can be planted in the center, and on the edges you can plant any kind of low-growing plants, such as violets, pansies, daisies, etc., or you can sow seed of sweet alyssum, verbenas, candytuft or parsley, lettuce, radishes, etc., if you have a mind.

The idea is to have a little of everything. You have no thought how much pleasure you will find in this uniting of the beautiful with the useful. Try it in a small way first. Let the main walks be about two or three feet wide, making them lower than the beds by about four inches throwing the soil on the beds. These walks could be curbed by using a 2x4 scantling, or you could use 6-inch wide sods free from Bermuda grass. This sort of garden should afford you the best pastime and recreation, and it is particularly women folk that should take the greatest interest in it.—Farm and Floral World.

OUR FIRST TOMATO.

It may be of interest to know where the tomato was first grown in this country. The story is told, that a good many years ago, a man recently arrived from the Bermuda Islands, was committed to a Pennsylvania jail. He had with him a few seeds, which he planted in the jail yard, but before the plants came to maturity he was discharged. The plants bore strange fruit, which, as it ripened, changed from green to red, and was greatly admired by the prisoners.

The matron of the jail, sure that it was poisonous, cautioned all the inmates against eating the fruit, but as she desired to save speciments of it, she planted some of the seeds the following spring, and just as the fruit was well ripened, the man from Bermuda revisited the jail, and asked to see the plant. He called for pepper, salt, and vinegar, and to the astonishment and horror of the spectators, ate the fruit with a relish. Having finished, he told them that this strange fruit was a tomato, or having translated into English, a love-apple, and that it was wholesome and nutritious.

The seeds were therefore carefully preserved and distributed among friends and neighbors, who cultivated it as a curiosity, but it was long years before prejudice gave way to appetite, and this now most popular vegetable came into general use. Even now many people remember it as an ornamental rather than a useful plant. Probably more tomatoes are canned than any other fruit or vegetable, as they can be served in so many ways: eaten raw, with salt, pepper, and vinegar, or with a salad dressing, or plainly stewed in sauces, soups, preserves, and pickles. The tomato is ever ready for an emergency, and the provident housekeeper is sure to have it in reserve.

HOW THEY GROW STRAWBERRIES IN SOUTHERN STATES.

I am in the Chadbaum section, which produces and ships more berries than any other one point in the world.

You advise three-foot rows and 12 inches in the row. I take issue in both distances. I advise four-foot rows and 18 inches in the row. You need almost flat cultivation, which you can't give without more space to work in between the rows. Then, at 12 inches your rows at a year old will be a solid mass of bushes, the fruit small and ripen pale, while you want for good prices, a large, dark-red berry, which you can't get without room to let in plenty of sunshine.

I farm on the intensive plan and just as quick as I am through picking I dig a hole between the hills and plant one stalk of corn, skipping three hills each time. I at once set to working on my corn, which soon gives just enough shade to keep the plants in good condition through the hot weather without smothering them, and when the fodder is ready to take I use a sharp hoe, cutting off at the ground and carrying out the corn. Thus I have kept my berries clean and got pay for it in a good crop of corn. In order to not rob the berry patch, I put in 300 pounds of fertilizer when the corn is about six to eight inches high, and my berries come out 50 per cent. better in the fall than those where the corn is not planted.

I have raised four good crops on the same land this season. In November I planted in cabbage, then as soon as danger from frost was over I planted bunch beans between, and when laid by the beans the cabbage was off and I planted corn in the middle, and when I laid by the corn I broadcasted peas between the corn. I plant cantaloupes six feet apart, each way, and two stalks of corn between one way, then train the vines to one middle and sow the other in peas, and as soon as the cantaloupes are gathered sow the other middle in peas. I never put in a fresh crop without fertilizing it at the proper time, and depend on peas to enrich the soil, which they are doing very fast. Irish potatoes are planted five feet between the corn in the middle the last planting, then the peas broadcast when the potatoes are dug and the corn laid by. My land is a light, flourery soil and I am at a loss to know what grass will make the best meadow, and would be glad for information.

San Luis Obispo County Lands. Best and Cheapest in the State. Rainfall abundant. Colony Lots, Farms, Orchards, Stock Ranches, Town Lots, Business Openings, Mines. Offices opposite R. R. Depots, Oceano and Arroyo Grande, Cal. Call or write for price list.—Beckett Realty Co.

Reciprocal Tariff League.—A strong movement has been inaugurated in the East, among farmers and stock men, under the title above mentioned. It is strictly non-political. It is a movement to correct conditions now existing in the foreign market and growing worse for the American farmer.

It is in the hands of business men; mainly representing farming interests. The big movement of grain to Europe this fall is in anticipation of the closing of Germany's ports against us March 1st. We are already practically shut out of both Germany and France so far as our live stock and meats are concerned. We are losing markets worth $100,000,000 per year because the Blaine and McKinley Reciprocity policy has been "side tracked" by a minority in the United States Senate.

It is not intended to disturb the tariff system in the main, as it exists at present, but to create a wider policy which will open the door to expansion of our agricultural industries. We are producing faster than we can consume, with the inevitable result of stagnation of business in the not far distant future unless we can find an outlet for over produced commodities.

In one of his last public addresses, the late President McKinley offered wise council when he said:

"Our capacity to produce has developed so enormously and our products have so multiplied, that the problem of more markets requires our urgent and immediate attention. Only a broad and enlightened policy will keep what we have. No other policy will get more. In these times of marvellous business energy and gain, we ought to be looking to the future. strengthening the weak places in our industrial and commercial systems, that we may be ready for any storm or strain.

By sensible trade arrangements which will not interrupt our home production, we shall extend the outlets for our increasing surplus. A system which provides a mutual exchange of commodities is manifestly essential to the continued and healthful growth of our export trade. We must not repose in fancied security that we can forever sell everything and buy little or nothing. If such a thing were possible. it would not be best for us or for those with whom we deal. We should take from our customers such of their products as we can use without harm to our industries and labor. Reciprocity is the natural outgrowth of our wonderful industrial development, under the domestic policy now firmly established. What we produce beyond our domestic consumption, must have a vent abroad. The excess must be relieved through a foreign outlet, and we should sell everywhere we can and buy wherever the buying will enlarge our sales and productions and thereby make a greater demand for home labor.

The period of exclusiveness is past. The expansion of our trade and commerce is the pressing problem. Commercial wars are unprofitable. A policy of good will and friendly trade relations will prevent reprisals. Reciprocity treaties are in harmony with the spirit of the times; measures of retaliation are not. If perchance some of our tariffs are no longer needed, for revenue or to encourage and protect our industries at home, why should they not be employed to extend and promote our markets abroad? "

The farmers and stock men have felt for some time past that they were being robbed of markets for their surplus products which would come to them under a wise tariff concession. To illustrate:

Germany is the second largest buyer of food products in the world. She would probably take from $50,000,000 to $75,000,000 worth of American farm products annually under any fair scheme of reciprocity. France would buy perhaps half as much under reasonable trading arrangements. The American farmer has a 4,500,000,000 crop of cereals this year. The question is what shall be done with the enormous product after the home consumption has been met?

* * *

Secretary Wilson's Annual Report.—The report of Mr. Wilson, Secretary of Agriculture, has been made public. As usual, he treats of agricultural conditions in a most interesting and comprehensive manner, so much so that we cannot well summarize the report in less space than is taken in this writing. Passing the subject of unreliable reports made by correspondents of the Department of Agriculture, which the Secretary calls special attention to, and refers to Congress for consideration, he takes up the subject of agriculture direct and summarizes the results of the year as follows:

Four crops make new high records as to value—corn, hay, wheat, rice, although in amount of production the corn crop is the only one that exceeds previous yields. In every crop the general level of production was high, and that of prices still higher. Besides the enormous yield of wealth, the Secretary estimates that the farms of the country have increased in value during the past five years to a present aggregate of $6,133,000,000.

"Every sunset during the past five years," he says, has registered an increase of $3,400,000 in the value of the farms of this country."

This increased value, the Secretary suggests, is invested better than in bank deposits or even in the gilt-edged bonds of private corporations.

Analyzing the principal crops for the year, the Secretary says that corn reached its highest production at 2,708,000,000 bushels, a gain of 42,000,000 over the next lowest year, 1899; hay is second in order of value, although cotton held second place during the two preceding years. The hay crop this year is valued at $65,000,000. Cotton comes third with a valuation of $575,000,000; wheat, $525,000,000; oats, $282,000,000; potatoes, $138,000,000; barley, $58,000,000; tobacco, $12,000,000; sugar cane and sugar beets, $50,000,000; rice, $13,892,000; dairy products, $665,000,000, an increase of $54,000,000 over last year.

* * *

"The farmer's hen," the Secretary says, "is becoming a worthy companion to his cow. The annual production of eggs is now a score of billions. Poultry products have climbed to a place of more than half a billion dollars in value, so the farmer's hen competes with wheat for precedence."

There are more horses, and with a larger aggregate value, than ever before, notwithstanding, as the Secretary says, they were "threatened by the cycle and later by the suburban trolley and automobiles." He estimates their value at $1,200,000,000, or nearly as much as the corn crop.

Although milch cows are increasing in number and value, the report states that other cattle and sheep have for several years been decreasing. There are 17,570,000 milch cows, valued at $482,000,000. Other cattle are numbered at 43,669,000, with a value of $462,000,000. Swine number 47,321,000, valued at 283,255,000. In the aggregate the value of farm animals has increased a few million dollars within the year, and since the census of 1900 have increased 9 per cent. With this enormous production, the Secretary says, the wants of 83,000,000 people have been supplied with a surplus constituting a generous contribution to other nations. The exported farm products during the fiscal year ending June 30, 1905, had a value of $827,000,000, which was less by $51,000,000 than the average exports for the five preceding years. In accounting for this, the Secretary says that, owing to the short wheat crop, there was a decrease in the export of that cereal amounting to $41,000,000, of $5,000,000 in the exports of packing house products, and another $5,000,000 in fruits and other minor items. The increase included $9,305,000 in cotton; $4,700,000 in oil cake and oil cake meal; $4,000,000 in vegetable oils, and $2,000,000 in rice and various minor products.

* * *

"During the last sixteen years," the Secretary says, "the domestic exports of farm products have amounted to $12,000,000,000, or $1,000,000,000 more than enough to buy all the railroads of the country at their commercial value and this with a surplus for which there was no demand at home."

Secretary Wilson points out that the farmer is taking an important part in developing the manufacturing interests of the country by furnishing raw material and that he has also become a banker. The farm contribution to manufactories during the year were $2,673,000,000. Under the amendment of the national banking laws authorizing the incorporation of banks with a capital of less than $50,000, there have been 104 such banks established in the last year,, nearly every one of which is located in a rural community and the capital furnished by farmers. Speaking of the increase in deposits in banks by farmers, the Secretary states:

"In the North Central States farmers have been depositing money in the banks until the rate of interest on deposits has fallen so low that they have diverted a large portion of their savings to permanent investments. In spite of the fact that the banks do not receive and keep all or most of the farmers' savings the increase of bank deposits in agricultural States and the larger regions is most extraordinary.

"Still more remarkable is the bank statement for the South Central States. Deposits increased 18.1 per cent in Texas. For the first time in the financial history of the South, deposits in the banks of that region now exceed $1,000,000,000.

"The foregoing remarkable increase in bank deposits in agricultural States as well as the increase in the number of small country banks, are directly and indirectly because of the profits that have come to the formers from the operation of the farms. The man with the hoe has become the man with the harvester and the depositor and shareholder of the bank."

Secretary Wilson says the increase during the five years past of medium farms in the western division was $5.36 per acre, while the average increase for the United States was $27.53. Farmers are changing from less to more profitable crops.

The report concludes: "Should there be no relapse from his present position as a wealth producer, three years hence the farmer will find that the farming element, about 33 per cent of the population, has produced an amount of wealth within ten years equal to one-half of the entire national wealth produced in three centuries."

* * *

The Business Situation.—Notwithstanding the flurry in the New York money market last week, and the agitation of reform running through the life insurance examinations, the collector of customs of the port of New York announces that while October of last year was a splendid month for business, October of this year shows up a much better record.

For example: In October, 1904, imports of gold amounted to $1,291,989. October, this year, they amounted to $7,410,407.

October of last year our exports from that port amounted to $47,000,000. This year there is an increase of $1,000,000 for the corresponding month.

Every official report bearing upon national trade tells the story of an expanding prosperity for the American people.

From a California standpoint, conditions could scarcely be bettered. The timely rains of the season have put the ground in fine working order for the putting in of grain crops, the prospect for a bountiful return of citrus fruits was never brighter than today, while money literally rolling into California from Eastern real estate buyers and homeseekers insures an easy market for a year at least.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

The first carload of olives was shipped recently from near Elsinore, to Los Angeles and brought $65 per ton.

About one-third of the Julian apple crop which was still ungathered was ruined this week by the snow and cold weather.

According to statistics furnished the supervisors this month, there have been more oranges than peach trees planted out in Tulare county in the past year.

The Victoria Avenue Citrus Association of Riverside has abandoned the co-operative plan and has begun proceedings in the Superior Court to wind up its affairs.

The walnut crop throughout the Saticoy section is very light, only fiev have been shipped so far, while last season thirty-six cars were shipped up to the same date.

Thirty carloads of oranges went out from the Orange depot of the Santa Fe during the week ending last evening. The shipments of green peas are becoming quite heavy.

The grape season has just about ended. The shipment from now on will be mostly apples. It has been a fine season for grapes. The crop has been good and the prices excellent.

Reports from Anaheim state that the Loara walnut crop is very little this year. The shipment last season amounted to twenty-two cars, while this season there will be only ten or eleven.

The cherry crop in California was short this year. Only 75 cars left the State. We should have at least 275. The pear crop was also short. The shipment numbered 1012, but it should have been 1700 or 1800.

The California peach shipments this year were heavier than ever before. The total number of cars shipped was 1946. Peaches brought good prices in most instances. The shipments of plums and prunes were also heavy and good prices prevailed.

The apple shipment will be heavy. Most of the apples are forwarded from Watsonville and the Santa Cruz Mountains. The crop this year is a good one, and the apples are as fine as any to be had. Altogether the season has been a most successful one.—Sacramento Bee.

The deciduous fruit season, which is just about ended, has been one of the most successful that the California fruit growers have ever experienced. Crops were large on all varieties of fruits with the exception of cherries and pears, and high prices prevailed all during the season.

Valley Center, in San Diego county, seems, from late reports, to be one of the most productive regions of the south. They report the sale, during the past season, of apples to the amount of $10,125; hay and grain, $7,600; creamery products, $5,000; cattle and hogs, $8,200; fruits, $3,500; and wood, $7,800, besides many products o flesser note.

The total number of cars of California deciduous fruit distributed in the Eastern market this year has already reached the enormous figure of 7583. This is 2496 more than were shipped to an even date last year. It is also larger than the shipment two years ago. The shipment this year will be the largest of deciduous fruits ever forwarded from the State. It will number more than 8000 cars.

J. E. Burnham of Pomona writes that "the Columbia Everbearing Raspberry so closely resembles the Black Cap that one would take it for it, but for the purple color. They grew luxuriantly and bore finely through June July and August. Since then they have borne lightly, but some are yet blooming. They grow fine, large canes and bear prolifically, a single cane sometimes bearing 500 berries. They propagate by tipping the same of the Black-Cap.

Redlands orange shippers have fixed a price of $2 per box f. o. b. Redlands, as a figure below which no oranges will be sold rfom this time until December 10. This agreement was entered into Saturday evening at a meeting held in the office of the Orange Growers' Association. There were present representatives of all the shippers in the city and in what is known as the Redlands section. This custom of fixing a price for the holiday fruit has been practiced for several years and it has resulted in holding up prices and stimulating the market.

AGRICULTURE.

Estimates are that the Orange county crop of lima beans will run about 80,000 sacks, while there will be about 4,000 sacks of the black-eyes

Imperial, Brawley, Holtville and Calexico are each expecting to hold a Farmers' Institute early in December.

About one-half of the crop of the Santa Ana Valley Walnut Growers' Association has been harvested, and it is now believed that the crop will fully come up to the original estimate of about forty cars.

The California-Mexico Land & Cattle Company has 4,000 acres of Kaffir corn in one patch near Calexico. There are 1,200 acres in corn on the adjoining ranches of Stahl Bros. and Pearsall Bros., Brawley.

Holtville, in the Imperial Valley, reports that garden vegetables, cucumbers, tomatoes, egg plant, green corn—all home products—are as beautiful now as at any time of the year. The second crop of tomatoes from the same vines is just coming in.

MISCELLANEOUS.

The latest reports from the Colorado river are to the effect that the work being done to control the inflow into the Imperial intake is proving successful and it is expected the entire flow will be turned down the old channel within a few days, perhaps by the first of next week. Arrangements are being made to run excursions from Los Angeles to see the work as soon as it is completed and the water turned on.

The Annual Convention of the California Water and Forest Association has been called to meet in San Francisco on Friday, December 1. The convention will be assembled at 10:30 p. m., in the rooms of the San Francisco Chamber of Commerce, and will discuss questions of vital importance to the farmer regarding irrigation and conservation of our water supply.

The crop of mustard that has been raised in the vicinity of Lompoc this year is reported to be by far the largest that has been produced in that section since the cultivation of the seed was commenced. Prices also have been exceptionally high and those who have not previously contracted with the commission houses for the sale of their output are reaping a rich financial harvest from the product of their mustard fields.

A ton and one-half of beans to the acre is the record of the Ballard ranch in the Carpinteria valley. This equals the heaviest yield ever known in the county. The crop amounted to about 150 tons.

C. C. Donovan handed over to the mayor of Santa Rosa a check for $6,361.11 for 243 bales of hops from the city's hop yard, the price paid being 10½ cents per pound. The amount goes into the city treasury and will help bear the financial burdens of the Rose City.

The relinquished portion of the Round Valley Indian Reservation comprising 66,000 acres in Mendocino and Trinity counties, will be opened for entry and settlement January 15th, 1906. Plats and full information can be obtained from U. S. Commissioner Con. H. Goldberg, Covelo, Cal.

The hop growers of Ukiah Valley met at Ukiah November 18, 1905, at the call of T. J. Fine, who stated that the object of the meeting was to adopt a uniform price ofr working hops. It was found that prices ranging from $14 to $21 per acre had been paid.

H. W. Hellman has sold to Christopher Reiker of Hollywood, 114 acres south of San Gabriel for a stated consideration of $17,100. The land is to be utilized for truck gardening.

LIVE STOCK.

E. E. Moore, Compton, Cal., advertises some thoroughbred Jersey calves for sale in this issue. His stock is high grade, as advertised.

The sheep raising experiments carried on this year in the Imperial Valley have been very satisfactory, though the coyotes have taken a goodly number of wool-bearers. Their feeding along the canals and ditches has a peculiar economic value in that they keep the banks free from vegetation, trampling them down hard and not caving the soil down into the water as is the case with cattle. It is estimated that enough food goes to waste in the valley to feed at least 50,000 sheep.

A farmer near Santa Rosa says that he has 15 acres that will keep 15 cows all right. Commencing with the natural growth he had excellent green feed for four months, chiefly bur clover, then for over a month he fed green oats. Corn suckers and tops kept up the flow of milk in his Jerseys for six months and the field yielded 70 bushels of corn per acre.

The first State poultry show ever held in California under the combined management of all the poultry organ- postoffice building, foot of Market and continues for a week at the ferry postoffice building, foot of market street. It is the largest exhibition of the kind ever held in the West, the exhibits being among the best ever shown. There are more than 2,000 head of poultry of various kinds, embracing nearly every known variety, and also 1,500 head of pigeons. Incubators will be hatching chickens every day, and there are exhibitions of all the phases of poultry raising.

U. S. Department of Agriculture, Climate and Crop Bulletin of the Weather Bureau, California Section, for the week ending Monday, Nov. 27.

General Summary.—Cool and partly cloudy weather prevailed throughout the State the most of the week, with light frosts in some sections. Showers were of frequent occurrence and fairly heavy rain fell in all sections at the close of the week. The mountains are deeply covered with snow. High winds on the 20th caused some damage in the south.

The light rain of the preceding week was followed by drying northerly winds and very little good resulted from it, but the rains of the current week have been rapidly absorbed by the soil and will prove of great benefit to vegetation and orchards. The soil is now in very good condition, and plowing and seeding will be resumed at once. The rain was badly needed in the central and northern sections, both for the softening of the soil and to start feed. In Southern California the earlier rains had started pasturage and early sown grain, both of which are now thrifty; the soil is in excellent condition and work is progressing rapidly.

Orange orchards in all sections are greatly improved by the rain. Southern California oranges are ripening slowly but satisfactorily Quite a large portion of the crop in the Oroville and Porterville districts has been picked and shipped, and harvest is progressing in all sections. Walnut picking is completed in some places and the yield is below average. Olive picking and pickling are in progress.

Eureka Summary.—Rain the latter part of the week put the ground in good condition for plowing and seeding. Weather too cold to start grass. Apple shipments continue.

Los Angeles Summary.—Weather favorable for vegetation in all sections except southern mountain districts, where snow damaged apples and rain beat down pasture. Occasional light frosts in some sections did no damage.

The Los Angeles office of the Cultivator has been moved to 115 North Broadway, (upstairs.)

WAIT A LITTLE LONGER.

For announcement of biggest cattle sale to be held in Southern California at De Lamo, (2 miles south of Compton) December 19th. 330 head of of cows and horses.—Briggs & Weber, Auctioneers.

LINERS

FRUIT GROWERS, ATTENTION.—USE Griffith's Smudge Fuel. Don't let your fruit freeze when you can be protected by using Griffith's Smudge Fuel. Stoves, 50c each; 20 stoves per acre, stove good for ten years. Fuel $8 per ton; 16 lbs. to the stove lasts four hours. Address, 1023 So. Broadway, Los Angeles.

C. H. SESSIONS, ASSOCIATE EDITOR

ABORTION—CAUSES AND TREATMENT.

In the handling of a herd of dairy cows there are two diseases that in all probability will confront every dairyman, and a third that may. I refer to milk fever, abortion and tuberculosis.

A thorough understanding of the nature of these diseases on the part of the breeder, and what steps it is advisable to take to avert them if possible, and if they cannot be averted, what is desirable to do to minimize them, is essential to every dairyman.

In former issues of The Advocate and Dairyman, tuberculosis and milk fever have been discussed at length, and that is my purpose to do the same of abortion in this article.

In endeavoring to give the reader an understanding of this disease, I shall purposely clothe my words in the plainest language possible, so that they can readily be understood by every dairyman and breeder who has an interest in this subject, and I shall, for a like reason, abstain from all technical expressions.

"Abortion," in the case of cows, is the term used for the expulsion of the foetus before it can live a separate existence from its dam. It is possible for a calf to live, with very great care and under favorable conditions, after the two hundredth day of the cow's pregnancy. Techinically speaking, when the expulsion of the foetus occurs after the two hundredth day of pregnancy, it is called "premature calving," but among dairymen and practical breeders the dropping of a calf any time within 21 days of the full time it should be carried is called "Abortion."

Abortion may properly be divided into two classes—contagious and non-contagious. There might properly be called a third class—"sympathetic abortion," but it is generally divided into the two former—contagious and non-contagious.

Abortion, properly speaking, is a disease, If a cow loses her calf previous to its full time from some natural cause, such as a hurt, a fall, a slip, over-severe exercise, a blow, being chased by dogs, bad weather and exposure to cold rains, undue excitement, being injured by passing through too narrow a door, the presence of offensive odors, being taken long distances by rail in advanced pregnancy, it is abortion, though it may not be of a contagious nature, and while it may not be communicated to other cattle, the cow who has so aborted will be more subject to abortion with her next calf, and steps should be taken to avert its recurrence, about the time she aborted before, and for the month following. If your cow aborts and you cannot trace it to any known cause it will be safer to treat her as a cow who has aborted from disease. Isolate her from the rest of the herd. Examine her vagina carefully after she has "slipped her calf.' The natural discharge from non-contagious abortion is similar to the white of an egg; if there is any dark, murky, offensive discharge, or any white discharge mixed with the dark, murky matter, or specks like the fat of beef mixed with the clear, transparent discharge, you may be pretty well assured that it is contagious abortion, and such discharge is full of germs of abortion.

Non-contagious abortion may also be caused by drinking too cold water copiously, or ice water, or eating frozen roots which chill the stomach and reduce temperature of the uterus, to so low a degree as to kill the foetus. The over-feeding of cotton seed meal will produce it, and it is well known that smutty corn, ergotted grasses or bran from ergotted rye will cause abortion. While excessive chill to the stomach will produce abortion, acute fevers will also do it, from increasing the internal heat of the dam to such an extent as to kill the foetus.

Putrid, stagnant water is hurtful; both contagion of the foetus and abortion have often been traced to this source, and where pure water was substituted for stagnant the cause has been removed. Bloating will very often cause abortion, or disease of the ovories, kidneys or bladder. Abortion very often comes in wet years. Rye grass is especially subject to ergot, which is a fruitful source of abortion. Ergot and smut are not so injurious, if fed in conjunction with roots, ensilage, etc. Musty hay or corn will is a fruitful source of abortion.

Manure kept under the cow stable is a fruitful souce of abortion.

Long and exhaustive inquiries have been made into the causes and cure of this disease by the ablest veterinarians and scientists in this country and Europe, and it is generally conceded that the cause of contagious abortion is a germ. A head of cattle may be perfectly free from it, when suddenly it appears in one cow who will lose her calf from the third to the eighth month of pregnancy. This will be followed, after an interval of three or four months, by another aborting, and then in a few weeks to two or three months by another, and so on, until it at last obtains a perfect foothold in the herd, and unless checked and prevented will run its course through the entire herd. Were the cause traced to its true source, it would generally be found that some cow that has been brought into the herd introduced it, or that the affected cow has come in contact with a cow that has aborted, or that an attendant upon the affected cow has some time previously been attending an aborting cow, or that the utensils that have been used by him have been used near or with the affected cow, or it may be conveyed by the bull having served a cow that had aborted, thus introducing into the herd the germs of abortion.

Some cows will be bred to the bull, and then the next time they should come in "season" fail to do so, and possibly again at the next; then they will unexpectedly be in season again. This may be repeated by but one or many—and will probably occur frequently. While there may be natural causes that contribute to produce this irregularity, it is more often caused by the immature foetus being cast out, which is so small it is not found, but is really "abortion," and very often contagious—therefore must be treated as such.

The symptoms.—With a cow in milk there is no sign of approaching danger unless one is particularly on the lookout for it. If she be dried off, you may find sufficient warning in the flow of milk that will be made into her udder, the filling of the teats and swelling of the vulva, which loses its crinkled form and presents a fat and flabby appearance. But as a rule with a cow in milk she apparently is in perfect health and contentment, and gives you

Washed in 1 minute

A Big Difference

One Minute's Washing as compared to at least fifteen. Wouldn't you like to save at least fourteen minutes twice a day? **One minute** with a cloth and brush cleans the absolutely simple Sharples Dairy Tubular Cream Separator bowl shown in the upper picture. It takes fifteen minutes to half an hour with a cloth and something to dig out dents, grooves, corners and holes to clean other bowls—one of which is shown in lower picture.

Washed in 15 to 30 minutes

Count the pieces — notice the difference—and you'll understand why the one who has to do the cleaning prefers the simple Sharples Tubular.

There are other advantages just as much in favor of the Tubular. Write today for catalog V 260—it tells you all about the gain, use, and choice of a separator.

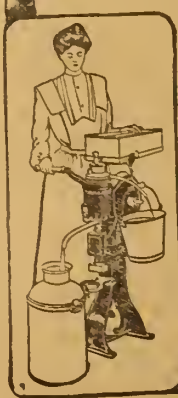
YOUR MONEY BACK = QUICK

5 Cows and a U. S. made $45.00 month
7 Cows but no U. S. made $11.00 month
The U. S. makes the difference $34.00 month

Staunton, Ill., Sept. 25, 1905.

I hereby certify that on April 20th, 1903, I bought of your agent one of your No. 7 U. S. Cream Separators, and after using it for more than two years, I am more than satisfied. In 1902 I sold the milk of my seven cows to the creamery and realized from said cows an average of $11.00 per month. From the herd in the spring of 1903 I sold two of the seven cows and milked the other five, and my income from the five cows was $45.00 per month. a difference of $34.00 in favor of the U S. Separator If necessary I will make affidavit as to this statement.

E. D Bruce.



Now, how quick did Mr. Bruce get his money back? Well, the *extra* profits alone paid for his U. S. in just about 10 weeks. Many thousands of satisfied users prove the

U. S. CREAM SEPARATOR,
[Which Holds World's Record for Close Skimming

is the most profitable separator a farmer can buy. It does the best work the longest time with least trouble and smallest expense, and it

no warning until too late to prevent the disaster.

With heifers who have never had a calf it is different; as a rule their udders swell gradually and the vulva distends slowly, provided they be six or seven months in calf.

When it occurs.—Abortion usually occurs during the fourth to the eighth month, but it may occur at any period of pregnancy.

With a cow that has aborted, the time at which she will abort with the following calf is usually extended a month; that is, if the cow has aborted for the first time in her fifth month, she will generally abort the next time in her sixth month, and following it, in the seventh, and so on. I have noticed, as a rule, that where cows would have aborted at the fifth or sixth month of pregnancy, had not the threatened abortion been averted, they have a natural tendency to abort the eighth month.

If a cow threatens to abort, remove her at once from the rest of the cows and keep her as quiet as possible. There are several advertised and well-known abortion medicines on the market. In an article such as this, I cannot recommend the use of any particular one. But some such medicine that you have been in the habit of using should now be given the cow.

If the cow is nervous you can give her, in addition to the medicine, one ounce of laudanum and repeat it in six hours. If the threatened abortion is accompanied by a discharge of matter unnatural to calving, such as I have heretofore described as indicating contagious abortion, the membranes of the calf bag have been affected and eaten away by the germ, and nothing will save the cow from aborting.

The same remark applies to a cow in which the membranes have been affected by the germ previous to treatment being begun, because no medicine will rebuild decayed tissue; or the calf may be dead at the time of the beginning of the treatment, and no medicine will restore life.

If, however, there be no rotting of the tissues when the cow threatens to abort, and you take her in time, you can possibly avert the threatened abortion. Any medicine used for that purpose to be effective must act as a sedative and a nervine, quiet the cow, take away the bearing down pains, and besides act as an astringent directly upon the uterus, tending to draw up the mouth of the uterus and prevent the foetus from coming away.

If the cow has aborted in the barn, and it is contagious abortion, remove her from the barn as quickly as you discover it. Remove the calf, the afterbirth and all discharge and bury them deep in the ground. Burn all straw that she has come in contact with. If any blanket has been upon her boil it, If any utensils have come in contact with her or the discharge, disinfect them thoroughly. Wash the floor, sides and posts of the mangers, and sprinkle the sides in the locality in which she was with a disinfectant. Wash the tail, vulva, hind quarters and udder of the cows in the stable who are pregnant with a disinfectant. Repeat this washing every day for a week, and three time a week thereafter for a month. Disinfect the barn by burning sulphur, closing up all windows, doors, etc.

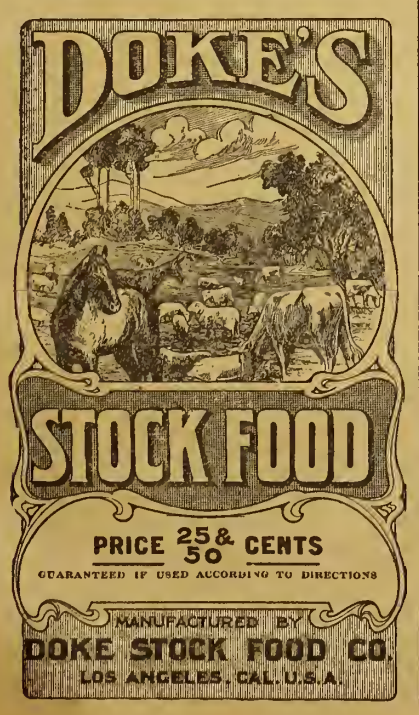
An excellent disinfectant is made by dissolving one dram of corrosive sublimate, one ounce of alcohol and glycerine, and shaking up well in a gallon of water. This may be used both as a wash and an injection. It is poisonous and must be kept carefully out of the way of man and beast.

The reason why all these precautions are taken is, that if it be a case of contagious abortion the cow in discharging the foetus will discharge with it the germ of abortion, or previous to calving she may have thrown out this germ with the discharge. It seeks and obtains a lodgment upon the rear portions of the cow, is taken into the vagina and passes into the uterus, where it begins its deadly work. After a time it eats the membranes of the calf bag, causing them to slough off, and the foetus is discharged, carrying with it innumerable germs, and leaving in the uterus of the cow similar germs.

The object of burning sulphur in the barn is to destroy these germs. If by any chance they have found lodgment in the vagina of other cows, they are destroyed by the injection If they have not found lodgement in the vagina, but upon the rear portions of these cows, by washing with bichloride of mercury disinfectant you destroy these germs and prevent their being taken into the vagina, and later passing into the uterus.

This injection is best accomplished by the use of a rubber hose about four feet long, which can be inserted far into the vagina—as far as it will go—raising the part of the rubber hose out of the vagina to an elevation higher than her back, and inserting in that end of the hose a funnel through which you pour the injection. In this way the injection reaches nearer the uterus than it otherwise would do.

We will have something more to say on this subject in our next or an early issue.—Valency E. Fuller.



SORE TEATS.

Editor Cultivator: I have a young cow with sore teats, what shall I do for her?—S. C. P., Azusa.

Wash her teats with warm water and castile soap and wipe dry. Then apply this lotion:

One part turpentine and two parts lard and thoroughly mixed by melting the lard, then adding the turpentine and stirring until cold. Keep this mixture in the cow barn and whenever a cow's teats show a tendency to chap or crack, rub a little on after milking.

ADULTERATED BRAN.

A press bulletin from the Pennsylvania Experiment Station says:

The station has recently examined a sample of bran submitted by a Westmoreland county farmer with a statement that cattle refused it and when they do eat it are purged, and that hogs eating it sicken and die, one farmer in that county having lost six hogs in this way. Upon examination the bran was found to contain rice hulls.

These hulls, produced abundantly as a waste from the rice milling industry, differ materially from the hulls of barley, wheat, rye and oats because of the fact that they contain sharp particle of silica. These are extremely irritative to the mucous lining of the digestive tract of the animals eating the hulls. The irritation produced is so intense that many animals are sickened and often killed because of this action of the rice hulls. Hogs and heifers have been especially injured where attempts have been made in the southern states to feed this product, and the experience in this locality has shown these hulls to be an absolutely dangerous ingredient of stock food.

Rice hulls have been found in western samples of wheat bran sold in New England and in the middle West, but this is the first case, to the writer's knowledge, in which the adulterant has appeared in Pennsylvania. The sample in question showed large particles of yelow hulls that were readily detectable upon careful examination of the bran by the unaided eye. With a low power lens the outer surface of the hull is seen to be marked by fine parallel lines covering the whole surface quite uniformly and extending parallel to the long axis of the hull. This appearance is quite different from that shown by barley and oat hulls. Owing to the extremely dangerous character of this adulterant, buyers should be especially on their guard against it. Not long since a dairyman near Long Beach complained to the Editor of the Cultivator that he was getting adulterated bran, and his cows were showing the effect in the milk they were giving. It would be well to examine the bran before buying in any considerable quantity.

AVERAGE FARM CATTLE.

"The kind of farm we have, nearness to market, and our likes and dislikes are all to be taken into consideration when determining the kind of cattle we handle, writes M. C. Logan in Successful Farming.

The amount of clear money that can be made is what counts in any line of farming. If situated near a good market that will take all the butter, cream and milk that can be produced at a good remunerative price and we have a liking for the work and are willing to watch closely every little detail that goes to make up a successful dairyman, then by all means select a dairy breed. But if not near a good market, select one of the beef breeds. By careful breeding and good management I know of no better way to make the old farm pay, if adapted to stock raising. I have calves come the last of February and March, and by the time grass is ready to turn, the calves are at an age to stand the extra flow of milk and make rapid gains from the start. We usually let them suck until about six months old but long before this they are taught to eat shelled corn, oats, bran, etc., and a few weeks before weaning the milk supply is gradually decreased until it finally ceases entirely and with the grain and plenty of good grass their development is steady and regular."

BEDDING COWS.

These are pretty cool nights, and they will soon be cooler, and wet, as well. The cows will have to be sheltered in barns or sheds and the problem of bedding them is up to the farmer. It is very necessary that the cows be well bedded, that they may rest well as they lie chewing their cuds, for at that time the manufacturing process of milk production is going on and is greatly influenced by the comfort and humor of the cow. In selecting a material for bedding, the cost must, of course, be one of the chief considerations. After this its power to keep the animals clean, the amount of dust it contains, and its effect upon the land when hauled out with the manure, may be considered.

It must be said that sawdust, everything considered, is the most satisfactory of materials used. It keeps the cows cleaner than anything else and stays in place better, and it not as easily shoved around as is straw. It can be made to look cleaner and neater than other materials, and, unlike straw it is entirely free from dust and it makes good manure.

THE LITTLE FARM BUYERS.

Not long since two gentlemen were driving by the home of a successful farmer. As they passed the barn lots a thrifty little sow pig crossed the road before them. They remarked about the beauty of the animal, says Wallace E. Sherlock, in Farm, Field and Fireside, and the older of the two said: "You may not believe me, but I can take that little sow and in four years with her increase, buy the best eighty acres there is in this neighborhood and have enough hogs left to stock up the farm and pay a good share of the expense in their keeping."

At first thought the statement does not seem possible, but a little figuring will prove that it is not far from the truth. We will suppose that the sow and all her female increase will farrow for the first time when they are a year old, and give birth to a litter every six months thereafter, and that each litter will average six pigs, three males and three females.

At the end of the first year we have the sow and six pigs—three males and four females. In eighteen months the sow has a second litter. This brings the total up to seven sows and six males. After two years this sow has her third litter, and each of the three sows of her first litter also farrow. This gives us a total of nineteen sows and eighteen males. In two years and a half the three sows of her second litter are old enough to farrow. This brings our number up to forty females and thirty-nine males. In three years the sows of the first, second and third litters will farrow, and in addition the nine that were born to three of the first litter. This increases the number to ninety-seven females and ninety-six males. Thus it goes on in progression till at the end of four years, when we have a total of 508 females and 507 males, hogs enough to buy a good-sized farm.—Blooded Stock.

ALFALFA FOR BROOD SOWS.

Former Governor Hoard, of Wisconsin, is a great believer in the value of alfalfa, growing a great deal of it on his farm. In a recent number of his Dairyman he refers to his experience in keeping his brood sows in winter on alfalfa, says:

"Our own experience for two years in wintering brood sows on alfalfa hay has confirmed us in our opinion as to its great economy, as well as the fact that the resulting crop of pigs is much superior to those from sows wintered on corn in the usual way.

"The brood sow is called upon to create a number of off-spring, and it is but common sense to conclude that the food from which she is to derive the material for this important work should be of the right kind. The work of gestation calls for a large amount of protein in the construction of these little bodies. The food, therefore should be of a protein kind that is easily assimilated and digested. The second and third cutting of alfalfa hay, if it be nicely cured, seems to fill these requirements completely. An ear of corn or a pint of corn meal a day will furnish all the carbon that is necessary, though we have not used any corn whatever. The objective point in this treatment of the sow is to secure strong, vigorous pigs, that will survive and grow nicely. In this we have been more than satisfied. The sows keep in good flesh, fully as fat as we want them to be, and they eat the hay with great avidity. The cost of keeping is thus reduced to a very low rate which is something of a consideration in these days of high-priced feed."

OPERATING AN INCUBATOR.

(Continued from last week.)

Testing the Eggs.—All infertile eggs and dead germs should be taken out of the machine. Egg testers are sold with all incubators, and a very little practice will enable even a beginner to detect the infertile eggs.

To test the eggs, the tray should be removed from the incubator and placed upon a convenient table. If the temperature of the room is below seventy degrees it is well to put a light warm flannel over part of the eggs, to keep them from cooling too much. Put the tester on the lamp instead of the lamp chimney, and be sure that the flame is exactly opposite the hole in the tester. Hold the egg, with the large end up, close to the opening in the tester, and endeavor to look through the egg at the flame. Infertile eggs will be of a clear, uniform color throughout, except a slight darkening where the yolk lies. These should be placed in a receptable away from the tray. Fertile eggs show the germ like a dark irregular floating spot, and in white eggs the blood vessels can be discerned branching out from it. White eggs can be tested on the fifth day, dark eggs on the seventh day. Dark eggs are more difficult to test, as the light does not shine through them easily and the yolk may throw a shadow that can easily be mistaken for a germ. It is well in learning to test eggs to break a few, which may appear doubtful, and examine them. One can learn more quickly in this way how to distinguish the infertile eggs, and the knowledge gained is worth the sacrifice of a few eggs.

It is a great mistake to omit testing out the eggs; first, it is a saving, for the infertile eggs are perfectly good for cooking, they are merely eggs that have been kept for about a week in a rather warm place. Secondly, by removing them it gives more room on the tray for the fertile eggs, and they can be more easily turned and handled. Thirdly, the infertile eggs and dead germs are cold; they use up the heat and they chill the egg which lies near or touches them, drawing on its vitality.

* * *

A second test on the fifteenth day is necessary to remove the eggs containing germs that may have died since the first test. The dead germs usually have a slight odor which is not healthy; they have begun to putrify. They not only have an offensive odor by which to detect them, but they will show no development, will be a different color, and may appear streaky. All eggs containing dead germs should be removed from the machine and buried. On the fifteenth day, in the fertile eggs the chicks will be seen to nearly fill the shell except a small space at the small end and the air space at the large end. The movements of the embryo may be discerned at this time if the egg be held very steadily at the opening in the tester. On the eighteenth day the chick fills the entire shell except the air space, and the egg will be quite opaque as if two-thirds full of ink. To become accurate in egg testing requires practice and a brilliant light.

Follow the directions exactly and explicitly given with whatever incubator you may purchase. The makers of the incubator are anxious for you to succeed and have good hatches; it is to their interest for you to be successful. They have spent time and money in perfecting their own machines and understand how to manage them better than any one else.

* * *

One of the most important directions is that about the daily care of the lamp, for upon the lamp depends the hatch. The lamp must be filled and cleaned daily. The best oil must be used; the best is none too good. Inferior oil gives an unsteady heat. It is warmer when first lighted than ten or twelve hours later. Trim the wick carefully; never leave the corners of the wick high or ragged as a flame may result which will cause soot to be deposited in the chimney or smoke flue, checking the draught and liable to catch fire. Keep the tube clean and bright as well as every part of the burner, and thus lessen the danger of fire. A fresh wick should be put in the lamp at the commencement of each incubation. Great care must be used in getting wicks of the proper size and kind. If the wick be too large, or too thick, the oil will come up but cannot return, the burner and lamp will apparently "sweat" oil, there will be a disagreeable odor, and great danger of fire. The fires that have occasionally occurred can be traced to a defective wick or inferior oil. There must be a hole in the screw cap, where the oil is poured in, and if there is no hole, make one with a nail. This will prevent an explosion. Adjust the wick so that a moderate flame will keep the valve open about one-sixteenth of an inch. Trim and fill the lamp in the morning while the eggs are cooling, and if any change is required in the regulator do it at that time. Never touch the regulator at night. Do not fill the lamp quite full; leave an air space, otherwise when the oil warms it will expand and overflow and the lamp will flicker.

* * *

In a good incubator with a sensitive regulator it is rarely necessary to readjust the regulator more than twice during the three weeks of incubation. There is but little change during the first week in the temperature of the eggs, but when the germs develop and life begins to pulsate a considerable amount of animal heat is generated in the eggs and radiates from them. This increases as the embryo grows, and when the eggs show strong and vigorous fertility, about the twelfth day the regulator will require slight alteration and again on the fifteenth day after the dead germs have been removed. The eggs containing dead germs have no internal heat, and their influence is very chilling to the atmos-

BUYS THE WORLD'S FAMOUS EGG FOOD NO. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER

Used by all the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the GOLD MEDAL at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.

And Now Comes New Reward for Merit:

Read the following telegram received from the Lewis & Clark Exposition at Portland:

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

phere in the incubator as well as to the eggs that contain living embryos. As soon as the dead germs are removed there will be a rise in the temperature that must be controlled by the regulator.

* * *

The Hatch.—On the morning of the nineteenth day the eggs should be turned for the last time. The machine should be closed and kept closed until the hatch is over. Opening the door, especially when the temperature of the room is below 70 degrees during the process of hatching may spoil or seriously injure the hatch, as it will permit a large amount of moisture to escape and cold air will be suddenly admitted. This will dry up the lining skin of the eggs that are pipped and check or prevent their hatching. It may also chill the half hatched or damp chicks and will be detrimental to all of them.

The lamp must be trimmed and filled on hatching day as on other days. The temperature will rise when the chicks are coming out lively, and should it go above 105 degrees the lamp wick may be turned down a little.

Leave the chicks in the machine until they are thoroughly dry. At the end of the twenty-first day all the chicks that are worth anything will be out of the shell. The chicks should not be removed from the incubator until the twenty-second day.

Should the hatch not come off until after the twenty-first day it shows that the heat has been insufficient; if on the contrary it comes off before the twentieth day it shows that the heat during part or all the time has been too high. Too low a temperature will give a weak hatch, many chicks will die in the shell and those that are hatched will be weakly and will never amount to anything. Too high a temperature is almost as bad. Too high a temperature during the first ten days of incubation will cook and kill the germ. One hundred and sixty degrees is danger point up to the tenth day. Germs which die between the first and second testing are frequently the result of over heating.

Too high a temperature during the last week of incubation will so weaken the bowels of the chicks that they will be unable to assimilate the yolk of the egg. The yolk of the egg is nature's perfect nourishment, which feeds and nourishes the embryo in the shell. During the last day of the chick's life in the shell the part of the yolk which has not been absorbed is drawn up into the chick. This forms its food and nourishment for about three days after hatching. But should the egg be overheated this yolk hardens, and even if drawn up into the chick it becomes tough from overheating, almost as if it were cooked and the chick's bowels weakened by the overheating are unable to assimilate or digest it. The yolk stays there like a bit of rubber, putrifies, blood poison ensues and the chick dies some time between the first and tenth day of its life. Chilling the egg during the last week has almost the same effect. It weakens the bowels, hardens the yolk and eventually the chick dies.

If our chats on "Biddy and operating an incubator" have been helpful, I will add a sequel to my story and take "Biddy and operating a brooder" for a future subject.

The Los Angeles office of Cultivator has been moved to 115 North Broadway, (upstairs.)

EDITOR'S QUESTION BOX.

[Questions are answered to the best of our ability and from practical experience. A request the editor makes is for enquirers to write only on one side of the paper, and always to mention the breed of chickens that may need treatment. Also to give all details as to symptoms, feed, care, etc.]

* * *

Lice.—(Mrs. A. M. F., Yuma, Arizona.) Can you tell me of any way that I can destroy the lice on my chickens? We have whitewashed the chicken house, and cleaned it out, put railroad oil on the roosts, sprinkled coal oil in their nests, and rubbed lard under the chickens' wings, and nothing seems to kill them. I want very much to know the easiest, quickest and surest way to destroy them, and I would be very grateful to you if you can help me.

Answer.—Make the following: Dissolve a bar of laundry soap in a gallon of boiling water, add to this a gallon of coal oil and one pint of crude carbolic acid, churn these together until cold. Take one quart of this mixture and put into ten quarts of warm water. Wash the hens thoroughly in this, soaking every feather to the hen's skin. Pull out all feathers that have nits (lice eggs) on them. Do this on a warm sunny morning. Examine in a week and if there are any lice repeat; or you might after once dipping your hens powder them thoroughly once a week or oftener with Lambert's death to lice. Paint the perches once a week with Lee's lice killer, but do not put it in the nests. It will flavor and spoil the eggs.

* * *

Limber Neck.—(A. N.) Could you kindly tell me through the columns of your paper what is the matter with my chickens? Please give cure also.

We have lost nearly seventy grown chickens in the past two or three days. The same disease took several before we had any rain, but the most have died since. We feed grain, bran and green feed as we have done for years. They have plenty of fresh water, grit and charcoal by them. A few died that were in pens, but the majority had free outside range on alfalfa. Some roosted in houses, others outside in trees. Surroundings are moderately clean, chickens are in good flesh and look as though they would soon lay. Pullets, old hens and roosters go alike. They have had no rotten potatoes. They are apparently in the best condition, when all of a sudden the head drops, they become paralyzed, and in some cases they are dead within a half hour, others linger several days motionless, while a few get well.

Breathing is somewhat hard, but it is not dyphtheria. Droppings are a trifle more watery than natural. We have plowed and sprayed the ground with crude carbolic acid, and we now seem to have the disease somewhat in check, but not entirely. No lice nor mites, nor can it be cholera from the color of droppings.

Answer.—Your fowls have undoubtedly what is called "Limber Neck." It is a disorder of the nervous system caused either from severe indigestion, over heating, worm parasites or poison.

It frequently comes from the use of spoilt meat or bad animal meal, or ptomaine poison of some kind, perhaps in milk. It is difficult for me to guess at what caused it in your flock.

Dr. Sanborn recommends a small piece of assafoetida or a two-grain capsule of assafeotida. Repeat the

dose the second day. Dissolve one teaspoonful of hyposulphate of soda in half a cup of water; give a teaspoonful every three hours.

Bruised garlic fed freely, mixed with bread crumbs has also proved efficacious.

* * *

Tar.—(F. W. D., Sonoma). I am constructing a new brooder house, and in order to make a floor that would be thoroughly tight and not warp from the sun constantly shining on it, I intend to first throw fine sand over the floor and by sweeping off the surplus the cracks would be filled, then I will take very hot tar and give the whole floor a liberal coat. The tar being hot, will penetrate the wood and fill the cracks with sand and make a surface that will not be affected by the sun.

Now, what I desire to know before doing this, is whether there would be any objection to this method, or if the tar would be injurious to the little chicks if they should be able to pick any up.

Answer.—I do not think there would be any danger of the chicks being injured by the tar. It would be desirable to put a good layer of sand over it for the chicks to run on so that their tender feet would not come in contact with the tar.

* * *

Chickenpox.—(G. W., Pomona). I am doing a little in the poultry line, and have got some sort of disease among them; have tried to find out from other dealers down here, but none of them know anything about it. It commences with a running at the left eye, and the eye closes up, the beak turns a dark color, almost black, the cockerels get black spots like scabs or warts on their combs and wattles. If you can tell me what it is and what to do for them you will confer a great favor and I will be truly thankful. They are Rhode Island Reds.

I have some ducks. I got the eggs from Miss Dyer of Ontario. Would they be considered inbred?

Answer.—Your fowls have chickenpox. Wash their heads with warm soapsuds, to which add a teaspoonful of carbolic acid. Then grease the spots well with carbolic salve or carbolated vaseline, and give a little sulphur in their food. It is an infectious complaint and is caused by a germ. Mature fowls rarely die of it, but it kills young chicks and will prevent hens laying.

Miss Dyer's ducks are very fine and not inbred.

* * *

Standard Points.—(W. B. C., Modesto). Could you tell me how to find what are the accepted "points" required to pass fowls as White or Brown Leghorns, Black Minorcas, etc.? Are not the last practically the same thing as Black Spanish?

Answer.—You had better buy the new edition of the American Standard of Perfection. It has just been printed, giving the points for all the breeds. All poultry breeders should own one. The Black Spanish are white faced, otherwise they greatly resemble Minorcas.

HINTS TO BEGINNERS.

If your flock is composed of the common barnyard fowl, and you wish to improve your flock, get a setting or two of eggs from some reliable breeder of the variety you want to keep and make a start, says the North Dakota Farmer. The cockerels from the setting will be sufficiently numerous to take the place of all the old cocks on your place. Kill or sell off the old cocks as soon as the young ones begin to crow, and in this way grade up your flock. From such a beginning it is easy to convert the common flock into a thrifty flock of "grades" and at the same time have a pen for breeding purposes of pure strain. These may be used to bring up the home flock and to sell to others desiring to introduce pure-bred stock on the farm. Gradually remove all the old stock and "grades," and in a few years your farm will be stocked with pure-bred poultry of one standard variety, and it is best to have but one variety. It will save lots of work in preparing separate houses and separate runs for the separate breeds.

The White Plymouth Rock or the White Wyandottes are good, all 'round breeds. If you must have other fowls, put in Pekin ducks, Bronze turkeys, or Toulouse geese, thus having a variety, but nothing that will mix or give you extra trouble. Then be vigilant in your care of them; study them and make it easy for them to lay eggs by keeping them free from vermin, well housed and well fed. such treatment is sure to bring success, and that means that you are keeping poultry for profit.

If the American people will give more attention to their poultry it will be found that more profit from this source, in proportion to capital invested, is made than from any other farm animal. A hen without grit is like an old man without teeth—she can eat, but that is all. Food must be well masticated to be healthful, and grit is the only tooth a hen has. This applies to fowls kept in confinement. On the range they know how to take care of themselves.

Finely cracked mica is a good grit, or finely broken oyster shells, or coal ashes. See that the flock has all the water they want, and feed for a special purpose with good food, a little green food and meat scraps or fresh cut bone, but do not feed too much of the latter. Make good use of insect powder once a week for two or three weeks so that the mother hen will not be a breeding place for lice to get on the young chickens.

CALIFORNIA TURKEYS.

Turkey flocks are means of livlihood for a great many families in the Sacramento Valley, says a correspondent of the Country Gentleman. Turkeys are raised in flocks of from 500 to 3000 birds, valued at from $2 to $3 apiece. A flock of 3000 turkeys is more difficult to manage than a flock of 3000 sheep, for a turkey is a wanderer, a drifter and a tramp. The only way to keep the bird healthy and plump is to let it drift. The turkey herder merely follows the flock with his shepherd dogs, and in a general way directs the course of the bunch.

MIX THE DIET.

Laying hens need a mixed diet, with plenty of bulk; hay or bran, exercise with their hard grains, and a small percentage of animal food in some shape. Apples, cabbages, waste and trimmings of all vegetables, raw or cooked, and a warm, soft feed once a day, go far to complete that sufficient and stimulating variety which serves so well to fill the egg basket. Constant attention is, after all, the one indispensable requisite. There must be an interested eye that marks promptly every sign of ill condition and remedies the difficulty, whatever it may be.

Overfed hens get too fat to lay well.

General Agricultural Notes

DOES PUMPING FOR IRRIGATION PAY?

Below the surface is an extensive stream; this can be used for irrigation; the only question is, will the pumping of this water for that purpose pay? One of the many advantages of the pumping plant during our long, dry summers is that the water can be had and applied when it is needed and where it is needed. Irrigation is superior to the natural rainfall in a climate like that of California. In cases of this kind it is certainly an advantage to have plenty of water at your command. There is not much fertilizing property in water under ordinary circumstances; it is only at certain seasons of the year that the streams carry any great amount of this quality, and then it is at a time when the minimum of water is being used for irrigation. It is true that overflows often carry a large quantity of silt; but this silt is frequently deposited in the bottom of the ditches, and must be removed, but little of it reaches the soil. It is not proper to cite the Valley of the Nile; conditions there are different from those existing here. There the land is completely submerged by water carrying a large quantity of rich soil in suspension, and when the water gradually recedes this deposit left upon the land and enriches the old soil upon which it rests. As I have urged, one of the most important advantages with the pump is that we have the water when needed.

Don't wait until the open ditch comes; go down beneath the surface and get your water, where God keeps it in store for just such purposes. In Southern California 30 or 40 acres of alfalfa are often irrigated by pumping; they conserve this water by conveying it in cement pipes to where it is used; and they claim it pays to do this. The alfalfa is used in producing feed for dairy cows, and their milk is turned into butter and cheese, and this in turn is sold at a profit. Why cannot this be done here by the same means?

The speaker cited many instances where fruit growers had used pumping plants advantageously and profitably. He said that in many places where ditches existed pumping plants had been installed, and in all cases they had given satisfaction, because water was obtainable by this method later in the summer than was possible by the former. Your supply is always available. Hundreds of these plants existed throughout Southern California, and were deemed satisfactory and profitable. He said that it paid to pump at all times where conditions were favorable. In this locality water in abundauce was near the surface, and it was our duty to use it; God had placed it there to conserve it for man's benefit. If this subterranean stream were exposed to the sun's rays the evaporation would amount to about eleven feet during the summer. The best pump was the centrifugal, and gasoline engines were generally the best means of operating it; electricity was also good; in large plants steam was often used, with crude oil for fuel.

In Southern California the average depth of pumping was about 90 feet, but in some cases water had been raised upwards of 500 feet to reach higher levels to irrigate lemons, and it paid to do so. Where small holdings exist, the cost of plants were not very great, and the cost would be greatly reduced by co-operation among a number of those desiring to avail themselves of this method of irrigation.—Prof. D. T. Fowler.

OKRA OR GUMBO.

Okra is an ornamental Hibiscus (H. esculentus) from the tropics, the immature pod of which is used for flavoring soups and meat dishes, especially stews. No copper, brass, or iron cooking vessels should be employed in preparing okra, as the metal will be absorbed, the pods discolored and sometimes rendered poisonous. Cook in agate, porcelain, or earthenware.

The okra likes a rich friable soil, well pulverized and after a fair start, will use a considerable quantity of commercial fertilizers. Plant in rows four feet apart, in hills like corn, or drilled. Cover seeds one or two inches deep. When well established, thin to three or four in a hill or if in drills to a foot or two feet apart, according to whether the dwarf or large growing varieties are used. Down in Uncle Sam's plant garden at Santa Ana, they almost grow into trees. As soon as the plants begin to set fruit the pods should be gathered each day, preferably in the evening. The pods should be gathered irrespective of size, while they are still soft and before the seeds are half grown.

EGG LAYING CONTEST.

Results of the third annual egg laying contest at Sidney, Australia, have just been published. The Australian egg laying contests have become quite interesting to poultry breeders in this country for the reason that a number of hens from the United States annualy participate in the contest, and they usually make a very good showing.

Out of 100 pens which participated in this year's contest was incluuded Silver Wyandottes, White Leghorns, Black Orpingtons, Black Hamburgs, Buff Orpingtons, Buff Leghorns and many other of the well known egg laying breeds. It will be noted that the Silver Wyandottes head the list with 1224 eggs per pen, but that some pens of Silver Wyandottes did not lay much more than half that number. In other words it is but fair to state that no one breed carried off all the honors. A good many White Leghorn pens are close to the top of the list.

DEFORESTATION AND CLIMATE.

Dr. Hennig recently gave an address on the influence of forests upon climate before the May meeting in Berlin of the German Meteorological Society, in which he adduced a number of coincidents where the depletion of forests appears to have been attended by dryer conditions. According to Consul-General Gunther of Frankfort, who has summarized the address for the Consular Reports, Dr. Hennig said that the climate of Greece, where today only 16 per cent of the area is covered with forests, has become drier. An increase of temperature and decrease of rain are noted, as compared with ancient times. This is especially noteworthy in Attica, which was thickly covered with forests about 3000 years ago, and where hardly any rain now falls; while the heat in the open air attains a degree of intensity that would make the indulgence in athletic sports, once famous, now almost an impossibility.

Similar conditions exist in the peninsula of Sinai, where thousands of years ago the people of Israel found a luxuriant and fertile country, though today it is a desert. Palmyra, also once a flourishing oasis in the Syrian desert, presents today only a waste of stones and ruins. In Mexico, where the Spaniards cut down the forests in the mountains, droughts changing to devastating floods are now noticeable, especially in the neighborhood of the City of Mexico. In Algeria, where, since the middle of the last century, the forests have been cut down on a large scale, dry weather has increased; and in Valenzuela the level of Lake Tacarigua, to which Alexander von Humboldt drew attention, has been lowered in consequence, it is said, of deforestation.

WAIT A LITTLE LONGER.

For announcement of biggest cattle sale to be held in Southern California at De Lamo, (2 miles south of Compton) December 19th. 330 head of cows and horses.—Briggs & Weber, Auctioneers.

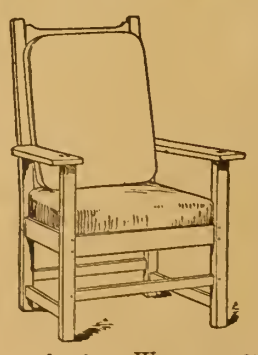
"Dependable Furniture at a Fair Price."
True Mission Furniture


The Old Mission styles of furniture are the most favored and the most used now. The plain, simple lines and the peculiar finishes of the weathered oak and the dark rich mahogany are decidedly pleasing and are in strict keeping with the bungalow form of architecture which is so popular in this section of the country. There is a great diversity of style and finish even in these special lines and just as great an opportunity exists for inferior workmanship. The mission furniture from the factory of the famous craftsman, Gustav Stickley, is acknowledged to be the finest in the country—made entirely by hand even to the smallest parts and every joint is mortised and pinned and made to fit perfectly. We are agents here for this superior furniture and constantly carry a very large and selected stock. All mail orders given prompt attention.
"All Goods Marked in Plain Figures."

Queries and Suggestions

RUSTY WATER PIPE.

Editor Cultivator: Please permit me to submit the following question: An irrigation (steel) pipe line of 16 inch put down sixteen years ago begins to burst now. Which of the two would you advise to do, lay an entire new line or cement around it the entire length? Yours, H. W. H., Gardena.

If your pipe is rusty the entire length you had better take it out and put in new. Cement is not very satisfactory. Water will in time break through it, and repairs must be continually made.

LOGAN BERRIES.

Editor Cultivator: Can you tell me how to prune Loganberry bushes? I think I saw in the Cultivator once that I should cut all off close to the ground, but it don't seem to me that is the proper way.—A Subscriber, Los Alamos.

Some growers cut them clear down, but more leave canes of the old growth about sixteen inches high.

PICKING OUT A COW.

Editor Cultivator: Can you give me any pointers on picking out a good milch cow. I have bought and sold again three cows which were guaranteed to be excellent milkers, but neither of them proved what was claimed for them. I am almost discouraged in the effort to find the kind of cow I want.—H. J., Imperial.

We do not know of any hard and fast rule to guide you in buying a cow. It is like buying a horse, we have to go a good deal on "looks." Some men can tell a good cow at sight, they walk around her, size up her points, and make up their mind as to the quality of the animal from her general appearance.

But there are certain natural conditions which attach themselves to a cow which one accustomed to looking at cattle will observe at a glance, and they may usually be depended upon to give a pretty good index to her character . These homely signs are helpful to one looking for a cow for family or dairy use. Some of these points we give here:

The cow ought to be of fairly good size, so that she can eat a good ration. She should have a large udder and good sized teats. Following the milk-vein along to the entrance to the body, in a good cow we should expect to find a hole large enough to take the second finger readily. Some hold that the vein itself should be large and crooked. The cows should have a thin neck and a slender tail. She should be wide between the hind legs . She should have a good, honest look in the eyes. She should stand handling well. When milked she should enjoy the process if the milker be a good hand at it. A couple of rudimentary teats behind the four fully developed ones are a good indication. If added to this we know the owner of the cow to be an honest man, and he tells us that the cow is a good one, if we can agree on the price we may be reasonably sure that we have gotten the worth of our money.

BUDDING ON SEEDLING ORANGES.

Editor Cultivator: Please tell me the best season and method for budding or grafting old seedling oranges to navels.—N. A. N., Pasadena.

Grafting has now given way to budding. The best time is in the spring when the sap flow is strong, though some bud in the fall and allow them to lie dormant till spring. Two methods are in common use: One is by cutting back old trees, forcing a new growth and budding into the best of these, removing the balance. The other, which has been very successful, is budding into the trunk or main branches of the seedlings, and afterwards cutting off the heads. The latter method has one advantage—all the buds may be inserted the same height—quite an item in regard to both appearance and availability of future crops in picking. This practice necessitates budding on high branched trees in the trunk and on low branched trees in the main branches, but the outcome is fine, evenly grown, well shaped trees.

ABOUT VIOLETS.

Editor Cultivator: Please help one of your regular readers by answering the following questions:

(1) Name of violet best adapted to this section? (2) How to prepare the soil for them and the distance between the plants? (3) What treatment necessary after planting to secure best results? (4) Will the plants do well if planted under trees? (5) Is there any known way of forcing them to bloom during the summer? (6) Where can I get plants and price per hundred? (7) Do you know of any book on the subject of violet culture in Southern California. If so, where can I get it? —L. C. S., Lemon Grove.

(1) Princess.

(2) Violets like a rich, loose soil, with a top mulch of light manure during the heated term and don't forget to give them a generous supply of water at frequent intervals. Put your plants in several exposures, not all in the shade, so that you may be able to gather violets over a considerable period. Growers disagree on distances. Some cultivate every other row with horse and keep the alternate rows close together. You then pick from the cultivated rows. Plant one foot apart.

(3) Keep the soil on top loose, free from weeds and use a manure mulch to work in surface soil, so that roots will be cool and moist. Never allow plant to get dry.

(4) Yes, if water is supplied to overcome the demands of the tree roots.

(5) Not that pays commercially. Summer is too hot for them. By resting them somewhat and then watering and fertilizing heavily you could get summer blooms under tree or in cold frames, but financially it would be a failure.

(6) Any advertiser of ornamental plants in this issue; see floricultural page. Cannot quote you price, that is the advertiser's business.

(7) None such has been written.

Special attention is called to the nursery advertisement of Stewart Bros., Los Angeles, Cal., in this issue. The firm is one of the oldest and most reliable in Southern California.

A subscriber wishes the names and addresses of several Holstein breeders in Southern California. Breeders who forward their address to this office will be placed in communication with the party.

There are said to be 150 carloads of cattle held for shipment along the Rock Island Railroad near Liberal, Kan., with not a car to take them. Some of the cattle, driven in from distant ranges, have been held for several weeks.

CALIMYRNA FIGS.

When California once commences producing figs (good figs like the Calimyrna) on a commercial scale, there will be as much demand for them as there is for other classes of fruit, for which California has already acquired a reputation. The ordinary White Figs have injured the fig business to such an extent that it is difficult to convince the trade now that California really produces a fig equal to the imported. Some of the dealers, who have not seen the Calimyrna Fig, came to the conclusion that California figs are worthless and always will be so.

The Los Angeles office of the Cultivator has been moved to 115 North Broadway, (upstairs.)

AUCTION SALES.

Elsewhere in this issue we print the announcement of two stock sales to be held by Rhodes, Reed & Rhodes, as follows:

On Tuesday, December 5th, they will sell for Math Lippuner at his place at Compton, 51 fine cows and heifers, besides farm implements.

On Thursday, December 7, they will sell for H. G. Hamilton at his ranch 2½ miles west of Downey, 250 head of blooded dairy cattle. Look up these ads. for full particulars.

SOUTHERN PACIFIC

IN GOD'S COUNTRY.

Miss Emma F. Edmondson, a former teacher in the Santa Barbara schools, wrote the following worthy verses. Miss Edmondson was ill at Indianapolis, Indiana, and this was the manner in which she accepted her brother's invitation to return to California:

I'm going back to California,
Where the sweet magnolia grows,
Where there isn't any thunder,
Any lightning, hail or snows,
Where the air is ever fragrant
With a million odors sweet,
And the salt of dear old ocean
That comes rollin' at your feet,
Where the scenes are ever new
And the skies are ever blue,
Where 'tis either Spring or Summer
In God's country.

I'm going back to California,
To its olive, fig and vine,
To its oranges and lemons,
To its peppers, gum and pine,
To its canyons, rocks and mountains,
To its valley and its sea,
To its sunshine and its poppies
And its grand Yosemite,
Where the scenes are ever new
And the skies are ever blue,
Where 'tis either Spring or Summer,
In God's country.

Breaking the News to Him

It was a difficult situation. To be sure, Marcella had not actually flirted with Ackley Henderson—she refused to include the verb in her well-bred vocabulary—but then—

Men are so queer—So apt to think that one means things when really one is actuated only by ordinary courtesy and the gayety of the moment and cheerfulness toward the world in general. When a man calls very regularly is that any reason why a girl should consider him in love with her? Marcella assured herself, indignantly, as she twisted up her hair. Why, dozens of men had called on her in the last five years, and only three or four had asked her to marry them. Each of these men had seemed surprised when she refused. Therefore, why should she worry for fear Ackley Henderson should take it badly and think himself ill treated when he learned she was engaged to an Eastern man? The wedding was set for June, and Marcella felt that she must break the news. She told herself that she would do it that very evening, and was surprised to find herself turning to ice at the thought.

She stared at her own face sternly in the glass. It was not that she had a lingering fear lest she cared for Ackley—not a bit of it! The man down East had all her heart, but she did like Ackley immensely in a friendly fashion, and dreaded his displeasure. Just why should she think he cared for her? She demanded a reply as she fiercely searched for another hairpin. He had never said anything, but then, words are not always necessary. One week ago, when she had been playing at the piano, on turning suddenly she had caught his gaze fixed on her with such an open tenderness that the blood had rushed to her face. He had carried it off well by asking in the next breath some irrelevant question, but it had started her to thinking.

Really, it was too bad for Ackley. He was such a reserved, odd person that one could never tell what he was going to do next. He never confided in his friends, though apparently he was free and open.

She searched her memory sharply. Had she ever given him the slightest right to fancy she was especially attracted by him? Of course, she had been interested in his yachts and his theories on the proper way to drive a horse, and his favorite books, but that was only what ordinary politeness called for. If one did not talk to a man about the things in which he was interested what on earth would become of conversation?

Marcella jabbed in the last pin and straightened her sidecombs, and just then the bell rang. Heaving a long sigh, she went down to greet Ackley Henderson. He was so particularly happy and cheerful tonight that it made her task doubly hard. How should she begin? She could not plunge into the subject abruptly—she wanted to glide into it gracefully and by degrees—but somehow she could not manage the conversation. And all the while Ackley beaming joyously at her.

Marcella shivered. She wished she could remember a few times when she had been rude to him—the memory would brace her up—but there was nothing but unremitting and gracious kindness on her part in the hateful past. She wondered if he would tell her what he thought of her when she told him of her engagement, or whether he would take it quietly and go away and brood over it. She didn't know which would be worse.

She chattered fluently on everything under the sun, but at last talk ran slow. Silence fell. Marcella felt it was now or never. She leaned forward and fingered the paper cutter lying at her hand and spoke in a low voice. She did not look at him.

"I'm going to tell you something, Ackerley," she said. She could feel that he was all attention, instantly. "I—perhaps I should have told you—told some people some time ago, but I—well, I didn't. I—you've met Bob Puyster of New York? I'm going to marry him in June.' She ended with a rush.

After an instant she raised her eyes bravely to meet his stricken face. Then she started in bland amazement, for Ackley Henderson was smiling surprisedly, delightedly.

"Why, I'm greatly pleased," he cried, heartily. "Van Puyster is a fine chap. I'm glad to hear it. And I might as well tell you there's a girl down in St. Louis that is going to be Mrs. Henderson next fall—and your profile and hers are identical. Every time I look at you I'm reminded of her, though, of course, you're not alike."

Marcella was speechless. For one mortal hour she had to sit and listen to the praises of another girl sung into her astonished and reluctant ears, and she smiled as though she liked it. Her own engagement he apparently dismissed from his mind. He was about the farthest from a heartbroken man one would care to see.

Yet when Marcella took down her hair that night she broke three of the shell pins, because she was thinking so hard and indignantly.

Girls, there is no doubt, are queer.—Chicago News.

A DANGER IN HOME MEDICINES.

When we read such articles as the following which attack our household remedies, articles which we keep in stock and have sworn by ever since we had a home—and before, too—it is calculated to make us wish Congress would hurry up and pass that bill to make food and medicine companies subject to government inspection and to punish adulterations thereof.

The medicinal writer of the New York Mail and Express presents these startling facts as to the dangers we encounter in using some of our most trusted home remedies. He says:

"We have on hand a bottle of camphor, extract of witch hazel, or bay rum to comfort the unexpected headache, cure cut fingers, or bathe away bumps and bruises. These remedies have come down to us from our mothers and grandmothers, who have profited by their use and have had every confidence therein; so we take their virtues for granted and seldom stop to consider their purity.

In this day of commercialism and substitution, some ignorant and unscrupulous manufacturers have taken advantage of this fact, and for the pure grain alcohol, which is the basis of most of these spirits and extracts, have substituted its dangerous namesake "wood alcohol." The reason for this is that wood alcohol is cheap, costing about 15 or 20 per cent. of the value of the pure grain alcohol, and by so doing enables the seller to attract trade by offering pints, quarts or gallons at a very small price. The danger of it is that wood alcohol causes sudden blindness and death. It is most distressing, is it not, to think that in some of our medicines we are buying that which will kill instead of cure? It is true, however. Dr. Frank Buller of Montreal and Dr. Casey Wood of Chicago, both noted specialists, have found through investigation, more than 175 cases of blindness and over 100 deaths for which wood alcohol has been directly responsible.

In an investigation recently made to determine the adulteration of commercial witch hazel, 70 samples were bought from as many leading drug and department stores in different cities, and analyzed. Out of the 70 samples, 52 were found to contain a large percentage of formaldehyde (poison) or wood alcohol (poison), or both, while the few remaining samples were weak and watery.

The distinguishing feature of wood alcohol poisoning is that it attacks the eye directly, and even where death does not ensue, total blindness is almost invariably the consequence. Poisoning from wood alcohol may be caused by its internal use and by absorption through the pores or a small break in the skin. Think of that and what it means. One of the children comes to you with a cut on his finger and you apply cheap witch hazel to prevent the soreness which follows. Suppose the witch hazel contains wood alcohol or formaldehyde (and it is likely to do so), the poison is quickly taken up by the blood, and blindness or blood poison is sure to result. Your husband calls for a bottle of witch hazel after shaving. If the witch hazel is adulterated with wood alcohol or formaldehyde, think of the chance of poisoning by absorption through the freshly-opened pores, or a slight cut left by the razor. You have a headache and bathe your forehead with camphor, or put a cloth dampened with common extract of witch hazel across your eyes. If wood alcohol has taken the place of pure alcohol in these remedies. and a drop of it gets into the eyes, total blindness is almost sure to follow.

There are a hundred and one ways in which we use these remedies and a hundred and one times we take chances of blood poison and blindness from the wood alcohol with which they are adulterated.

Now the question is, what is to be done? These remedies in their pure state are helpful, necessary and almost indispensable in the home; and we have a right to expect them to be pure. The thing we must do is to be sure of their purity when we buy them.

When you go into a store to make a purchase of this kind, call for the standard product of well-known reputation, and accept no substitute, that you may be guaranteed that it is the pure grain alcohol, and not poison, which has been used in the manufacture of these articles.

It rests with you as a duty to be sure that you have the right product, and to tell others of the danger of using a cheap substitute; and as the public demands its right, those who make or sell medicines which are not pure realize that they must make them pure. Always buy, even at a greater cost, a standard article.

Pat Murphy entered a Liverpool railway station. It was going to be his first ride on a train. As he approached the ticket office a young lady called for Marry Hill, single; it happened to be a station on the line. Our hero's turn came next. He shouted, "Pat Murphy, married!"

Doctor—Well, John, how are you today?

John—Verra bad, verra bad. I wish Providence 'ud 'ave mussy on me an take me!

Wife—'Ow can you expect it to if you won't take the doctor's physic?—Punch.

Cookery Recipes

Curries.—Curries are easily made if the experimenter is content to begin with simple receipts. Almost any meat or vegetable, not to speak of fish and fowl, may be curried, and experience lets the light in on a number of delightful combinations. Curried chicken is perhaps the best thing to begin with. Cut up the chicken as for stewing. Fry an onion, half a tart apple, and, if there is no prejudice against the fragrant herb, two cloves or garlic, all cut up fine in butter until of a golden color. Put the chicken in this, and fry until slightly brown The object is to sear the outside of the fowl. Now season with salt, white or red pepper, and two heaping teaspoonfuls of best curry powder Turn the pieces over and over to distribute the seasoning. Just cover with hot water, cover tightly, and cook slowly for three hours. Before covering, add half a cupful of grated fresh cocoanut. Just before serving squeeze in the juice of half a lemon, taste and add extra flavor if desired. Sometimes a few drops of kitchen bouquet greatly improves the flavor. Serve perfectly boiled rice in a border, and put plenty of gravy on each plate. Chutney should always be on the table. There are many varieties of this preserve, but one of the milder kinds, such as the world-famous "Major Gray's" is best liked.—New York Post.

* * *

Tomato Bouillon.—A can of tomatoes and a quart of strong bouillon, one small onion chopped fine, a bouquet made with six cloves, twelve whole peppers and a half a teaspoonful of celery seed wrapped in bayleaf. Boil and strain. Allow the bouillon to cool; heat again, and serve at once.

ABOUT UNDERWEAR.

Wearing woolen underwear is a subject which medical men differ over as much as any other subject. Some physicians recommend their patients, and even well people, to wear gauze cotton vests under their woolen vests. They recommend it for two reasons. In the first place some skins are so sensitive that they cannot endure wool next to them unless it is very fine and even then it is irritating. Secondly, the woolen garment does not require washing as frequently if a cotton vest is worn underneath to absorb the secretions from the pores of the skin. The cotton one may be washed each week, while the woolen one is aired and worn again without washing. Woolen garments thus wear much longer, as they often shrink badly, or the lye used in breaking the water or the soap rots them.

The fleece lined underwear has become quite popular. It looks pretty when new, but the fleece rolls and mats when laundered, and soon wears off. The weaves which throw a cotton thread underneath and a woolen one on top are also much used. If they are not sold as a deception there may be some merit in them.

Most persons would retain better health if they wore at least a light weight woolen garment during the cold weather. Wool is a poor conductor, so it forms a good protection for the body; it does not allow the body to cool off quickly and guards against changes of temperature. Those who can afford to wear silk underwear say it is just as warm as wool and more comfortable.

THAT LOUNGE.

One of the handiest things about a house is a lounge in the dining room, upon which father may lay down for a rest for thirty minutes after dinner. Then when the dinner work is done, mother can rest herself and be prepared for the work to come in the evening. If you can not afford to buy one, get the boys to make a stout frame and make a tick of unbleached cotton and fill it with straw. Take a well-worn quilt or old comfortable and fold it the right size for a mattress, and cover it with bright colored cretonne. Tack a curtain of the same around the frame. Add one or two cushions, and the lounge is ready for every-day service.

DRESS THE CHILDREN WARMER.

Out here in California the people do not pay heed enough to the dress of their children. They seem to think that because it is sunny California little folk do not need attention to their feet or dress. The fact is, children need warm shoes and stockings, flannels and warm clothes just as much in this climate as they do in the East. Not as heavy but light and warm.

THE REAL THING.

The venerable Goldwin Smith believes that, as an encouragement to matrimony, two votes should be allowed each married man.

A group of Canadians in a New York hotel were talking of the learned Prof. Smith affectionately.

"He believes in matrimony," one said. "He loves children. Children in their turn love him. They continually say to him the quaintest, the most interesting things.

"In a neighboring house, one day, he took a little girl on his knee.

"'My dear,' he said, 'where is your wax doll?'

"'Oh,' she answered, 'I don't have nothing to do with wax babies any more. We've got a meat baby here now, and that takes up all my time.'—Exchange.

Let the foundations of thy affections be virtue, then make the building as rich and glorious as thou canst; if the foundation be beauty or wealth, and the building virtue, the foundation is too weak for the building and it will fall; happy is he the palace of whose affection is found upon virtue, walled with riches, glazed with beauty, and roofed with honor.—Quarles.

I recently went to a railroad station to meet some of my wife's relatives and I saw a woman there with a lot of children, baskets, valises and no one to help her, but a girl with nothing to carry but an empty pocketbook and a mouth full of gum had enough escorts to start a town. There is need of equalization along this line.

"Any good shooting on your farm?" asked a sportsman of a farmer.

"Splendid," replied the agriculturist; "there's a canvasser man down in the clover meadow, a peddler at the house, a county board candidate out in the barn, and two tramps down in the stockyard. Climb right up over the fence, young man, load both barrels and sail in."—Credit Lost.

Mrs. DeSweet—I'd go and spend a week with my sister in the country if I thought you could manage the house alone.

DeSweet—Oh, I can manage it all right.

Mrs. DeSweet—But I am afraid you would be lonely and miserable.

DeSweet—Not for a minute.

Mrs. DeSweet—Then I won't go.

What-to-Eat: Mrs. Jenner Lee Ondergo—You discharged your kitchen girl for letting a dish fall to the floor; wasn't that a pretty severe punishment?

Mrs. Seldom-Home—Oh, I didn't mind that dish so much, but it had half a dozen poached eggs in it.

Little Amzi (who has an inquiring mind)—Do you s'spose, Uncle Bill, that a hen knows the difference between a real egg and a wooden one?

Uncle Bill Biderback—Sartin she does, Amzi. Ye never heard of a hen layin' a wooden egg, did ye?—Town Topics.

He calls her "Little Sunshine,"
Not because her flashing eyes
In the splendor of their brightness
Bear the light of sunny skies.

He calls her "Little Sunshine,"
Not because her golden hair
Has the glory of the sunlight
In its masses painted there.

He calls her "Little Sunshine,"
From no likeness to the glim
Save that now and then she makes it
Just a bit too warm for him.
—J. W. Foley in New York Times.

A CAPITAL PLANT FOR HEDGES.

Visitors are always admiring the silvery grey, neat looking hedges, which are to be seen in various parts of California, not guessing, perhaps, that they are made with a native plant, Atriplex Breweri, which grows on our coast, from Point Conception southwards; and is now popularly known as the "Santa Barbara salt bush." Hedges can be made with it from one foot to six feet high, and even more, if properly trained, and their neutral color form the very best back ground for flowering plants of any description. From the location where it naturally grows it is easily understood that this "salt bush" is hardy, and tough, as tough as can be. Moreover, it presents the advantages that it can be grown without any water, at least right on the coast where fogs are frequent during the summer; that it is not affected by parasites of any kind, and that horses and cattle will not touch it. Like other hedge plants it will need clipping quite often during the growing season. Although growing so quickly, it will never die off and leave unsightly gaps, as is often the case with the Monterey Cypress. In every respect it is well worth recommending for this special purpose, and for all places where a grey effect in masses is needed.

San Francisco Markets.

San Francisco, Nov. 29, 1905.

Dairy.

Butter met with a snappy sale yesterday, and the market opened displaying a firmer undertone. Prices for all grades of fresh stock were advanced sharply, and available supplies found a ready outlet at the improved figures.

BUTTER—Fresh, California extra, 30c, firm; firsts, 26½c, firm; seconds, 23½c, firm.

Eastern Extras, 24½c, steady; firsts, 23½c, steady; other grades nominal; Ladles, extras, 20c, steady; firsts, 19c steady; other grades nominal.

Storage—California extras, 24½c, steady; firsts, 23c, steady; Eastern extras, 24c, steady; firsts, 23c, steady; Ladies, firsts, 20c firm; firsts, 19½c, steady.

CHEESE—New California, fancy, 14c, steady; firsts, 13½c, steady; seconds, 12@12½c, steady; Young America, fancy, 14c, firm; firsts, 13½c, firm; seconds, 12½c, firm.

Eastern—Cheddars, 15½c, firm; Flats, 16c, firm.

Western — Cheddars, 14c, firm; Twins, 14½c, firm.

Storage—California fancy, 12½c.

Eggs.

Offerings of Eggs were heavier on 'Change and prices for selected Ranch were forced down 6c a dozen from Saturday's closing rates and values for the cheaper sorts were also lower in sympathy. During the last two weeks the high price for selected eggs has curtailed consumption, and in the endeavor to hold up prices there has been more or less accumulation in dealers' hands.

EGGS—Fresh California Ranch, selected, 40c, weak; firsts, 36c, weak; seconds, 32½c, weak; thirds, 30c, weak.

Eastern—Selected, 30c, firm; firsts, 26c, firm; seconds, 22½c, firm.

Storage—California selected, 27c, steady; firsts, 25c, steady; seconds, 24c, steady; California Store, selected, 25c; firsts, 24c. Eastern, selected, 25c, firsts 23@24c.

Poultry.

POULTRY—Old Roosters, per doz, $4.50@5; Young Roosters, $5@6; fryers, $4.50@5; Broilers, $3@4; Hens, small, $4.50@5; large, $5.50@6.50; Live Turkeys, lb, 20@22½c; Dressed Turkeys, 22@25; Ducks, old, $4.50, @5; young, $4.50@6; Geese, per pair, $2@2.25; Goslings, $2.25@2.50; Pigeons, per doz, old, $1@1.25; young Pigeons, $2@2.25.

Fresh Fruits.

DECIDUOUS FRUITS—Apples, per box, extra, $1.50@1.75; fancy, $1@1.35; common to choice, 50@90c.

Pears—Per box, Winter Nellis, $2@2.50; other varieties, $1@1.25.

Fresno, are as follows: 1905 crop: Seeded, per pkg: Fancy, 16-oz 8c; do, 12-oz, 6⅝c; choice, 16-oz, 8c; do, 12-oz, 6⅜c; fancy bulk, per lb, 8c; choice, do, 7¾c, Loose Muscatels, 50 lb bxs, standard, 4-crown, 6½c; do, 3-crown, 6c; do, 2-crown, 5¾c; do, seedless, 4½c; do, floated, 4¾c; Thompson's seedless, unbleached, 5½c; bleached, standard, 7c; do, choice, 8c; do, fancy, 9c, do, extra fancy, 10½c; seedless Sultanas, unbleached 4c; bleached, standard, 5½c; do, choice, 6c; do, fancy, 7c.

Honey and Beeswax.

HONEY—New crop, Comb, per lb., 10@12c; Extracted Water White, 6c; Light Amber, 5@5½c; Dark Amber, 3@4c; Hawaiian, 2@2½c.

BEESWAX—Per lb, 26@28c.

Beans and Peas.

BEANS—Prices per ctl: Large White, $2.25@2.60; small do, $3@3.25; Pea, $3.25@3.75; Lima, $3.40@3.50; common shipping points, $3.20; Red, $3@3.50; Pink, $1.75@2.15; Bayos, $3.50@3.75; Blackeyes, $4.40@4.60, Red Kidney, $3.50@4; Horse Beans, $1.25@1.75.

DRIED PEAS—Prices per ctl: Niles, $1.75@2; Green, $1.75@2.25; Field, $1.50@2.

Live Stock.

Conditions throughout all departments of the Live Stock market are purely a reflection of the features thoroughly reviewed for some time past. Sheep continue in scant supply and rule strong at full quotations and A1 Steers and Lambs share second place interest at firmly held rates. Calves and Hogs are plentiful at the familiar prices.

CATTLE—No. 1 Steers, 6½@7; second quality, 5½@6c; third quality, 5@ 5½c; No. 1 Cows and Heifers 5@5¼c; second quality, 4½@5c; third quality, 4c; thin Cows and Heifers, 3@4c; Bulls and Stags, 2@3½c. Prices for all descriptions less 50 per cent shrinkage.

CALVES—Light, per lb, 4¼@4¾c, gross weight; medium, 3¾@4c; heavy, 3½c gross weight.

SHEEP—Per lb: Wethers, No. 1, 4¼@4¾c. gross weight; Ewes, No. 1, 3½@4c, gross weight.

LAMBS—Suckling, $3@3.50 per head or 5@5½c per lb, live weight.

HOGS—Per lb: Hard grain fed, weighing alive 80 to 130 lbs 5½@5¾c, 130 to 250 lbs, 5¾@5⅞c; 250 to 350 lbs, 5¼c; rough heavy, 4@4¼c; common, 3½@4c.

Hops.

The price of desirable grades is nominal at 8@12c per lb, according to quality.

Hay and Cereals.

HAY—Per ton: Wheat, $11.50@ 16.50; Wheat and Oats, $11@15.50, Oats, $9@13.50; Barley, $8@11; Clover, $7@10; Alfalfa, $6.50@9.50; Stock, $5@7.

WHEAT, No. 1 Shipping, per ctl, $1.33@1.36½; inferior grades, $1.20@ 1.32½; White Milling, good to choice, $1.40@1.43¾; and $1.45 for fancy.

BARLEY—Choice No. 1 Feed, $1.17½ @1.20; some fancy grades up to $1.21¼; common to fair, $1.15@1.16¾; inferior grades, $1.10@1.13¾; Shipping and Brewing, $1.23¾@1.27½;

OATS—Good to choice White, $1.38½ @1.50; Red, 1.50@1.62½ for choice to fancy; $1.25@1.40 for common to fair; Black, for seed, $1.60@1.75; lower grades, $1.25@1.55.

CORN—Good to choice, per ctl: California, new, large Yellow, $1.32½@ 1.35; small, do, $1.55@1.65; Eastern Yellow, $1.37½@1.40; White, $1.32½; Mixed, $1.35.

RYE—New, $1.45@1.52½.

CITRUS MARKETS

New York.

Twenty-one cars of oranges and thirteen cars of lemons comprised the citrus offerings last week in this market, while for the same period last year only five cars of oranges offered and no lemons, while prices this season are fully as high as last despite the liberal offerings. Floridas are in liberal supply, but too green to sell well.

Tuesday's market brought seven carloads of navels and three of lemons. Oranges poorly colored and market declining. Lemons firm. Prices—Oranges: Navels, ex fy, $2.40 @3.55; ex ch, $2.35@2.95; ch, $2.35@ 2.50. Lemons: Fancy, $2.00@3.60; ex choice, $2.25@3.10; ch, $1.85@2.65.

The Los Angeles office of the Cultivator has been moved to 115 North Broadway, (upstairs.)

INTENSIVE FARMING.

(Continued from First Page.)

man of wealth who has a large tract of land may practice intensive farming to a certain extent, he may not, in the natural course of events, find his soil equally adapted even through the agencies of commercial, common and green fertilizers to the same general products. He is thereby compelled to divide his territory and practice intensive farming just as does the smaller land holder, and with the disadvantage of having many loose ends to hold together.

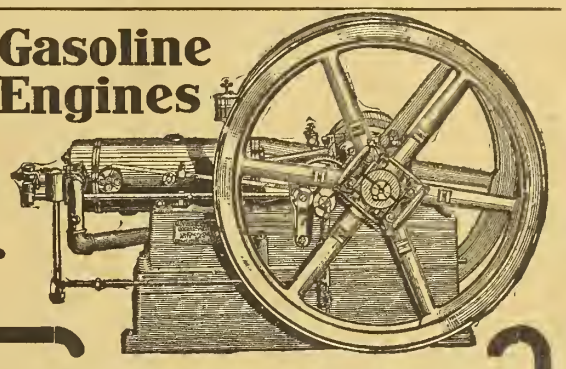
Smaller farms, then, and intensive farming, may be noted as the coming feature of the future for the Pacific Coast and Middle Western States.

Ranchers of the Alberta ranges, northwestern Canada, will have sent nearly 50,000 fat cattle eastward before the season closes. Stock is in much better condition than for years past, owing to abundance of grass.—Country Gentleman.

Waite, Bailey & Lynch, buy, sell, exchange, repair and install gasoline and steam engines, boilers, air compressors, power pumps, etc. Otto gasoline engines, all sizes, to 200-H. P., better built, more economical, therefore superior to all others; prices and terms that will insure due consideration. 943-945 N. Main st., Los Angeles, Calif.

I. H. C. Gasoline Engines

Best For Irrigation.



WHEN it comes to pumping water for irrigation purposes the "I. H. C." Gasoline Engines will be found the **simplest, safest** and the most **durable and economical.** They can be attached to any kind of pump, in any position, for raising water from deep or shallow wells, reservoirs, canals or running streams. They excel in **full, regular and long sustained power.** They can also be used for a general purpose engine for sawing wood, churning, cream separating, feed grinding, etc. They give the maximum of power at the minimum cost. No expert knowledge or trained engineer necessary to operate them. They are unequaled for power of all kinds. Made in a variety of sizes and in two styles. **Horizontal or Portable 6, 8, 10, 12, 15 Horse Power. Vertical, 2, 3, 5 Horse Power.**

Call on local agent and examine these engines or write nearest general agency for illustrated catalog showing how they will save you money.

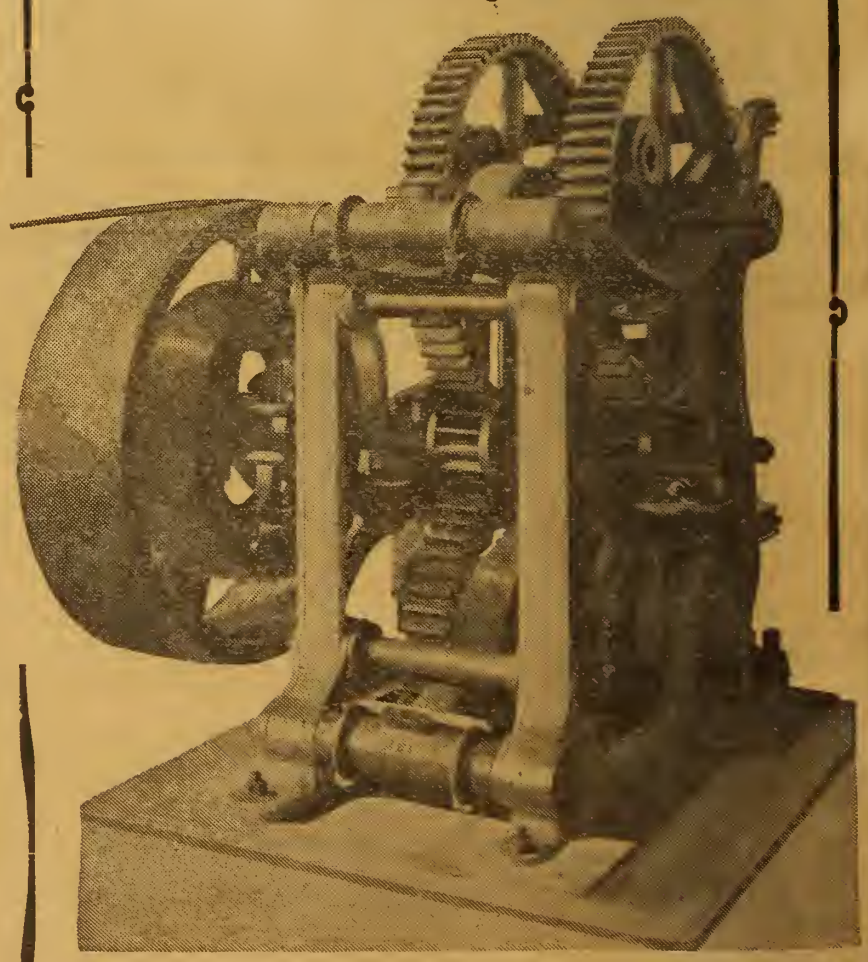
The Record for the New Pomona Pumps

FOR 1905

Not a Broken Rod, Not a Plunger Pulled for Repairs



The irrigation season just closing has demonstrated fully the high merit and efficiency of the New Pomona Pumps.

Every one installed has passed through the season's run without breaking a rod or requiring the valves to be pulled for repairs, proving conclusively that the ideal beam motion used by these pumps is more than has been claimed for it.

The slow, uniform motion upward and the quick, smooth down motion handles the rods without any jerk or jar, while the long lap of the plungers in passing the dead points, keeps the water column in continuous motion upward and a steady stream flowing from the discharge pipe.

They have passed through the experimental period and are built better than ever for next year.

The ideal pump for irrigation purposes. Send for catalog.

BARRED PLYMOUTH ROCKS

This popular breed of fowls had its origin in Massachusets more than forty years ago.

The Barred Plymouth Rocks combine largely the qualities of the Dominique cock and the Black Java hen, from which they sprung as a cross. They are fine egg producers and excellent for the table, as their flesh is tender and rich in flavor. Early maturers, they produce eggs correspondingly soon, while as mothers they are kind and gentle.

The laying capacity is considerably above the average of fowls. The pullets make excellent winter layers, the hens are at their best at eighteen months to two years, beyond which date they decline rapidly in laying ability, become persistent sitters and often very fat.

The other varieties of the Plymouth Rocks are the Buff and the White. In a general way, what has been said of the Barred, will apply to the newer varieties.

CIRCULATION EXCEEDING 10,600

Coulson's No. 3 Condition Powders

Keeps Fowls Healthy. Keeps the Hens Working. Changes Feed into Eggs.
You Exchange the Eggs for

$ $ $ $ $ $ $ $ $ $ $ $ $ $ $ $ $

INSTRUCTIONS

When you mix up the mash feed for the poultry, just stir in a handful of Coulson's No. 3, and soon all the hens will be singing, for it makes the feed taste good to them, it cleanses the liver, it makes the blood circulate, it reddens the combs, it strengthens the digestive organs and it INCREASES THE EGG PRODUCTION, for it goes right to the spot.

Egg Machines==Keep Them Working

You have chickens. Did you ever consider them as machines—machines that make eggs? Did you see in a recent Sunday paper where hens were made to lay SEVEN TIMES THEIR OWN WEIGHT in eggs in a year?

Now, every poultryman knows, or should know, the importance of having the fowls in good condition and in good working order. Hens that are protected in this way lay the most eggs during the winter months, besides they will lay eggs that will hatch STRONGER and HEALTHIERCHICKENS, therefore, it means future PROFITS and PROSPERITY. Your fowls should certainly be well fed and cared for during the Fall and Winter season, for every one wants eggs when eggs are high.

In the morning when you are mixing up the mash for the laying hens, just put in a handful or so of COULSON'S NO. 3 POULTRY POWDER, and see how lively it will make the hens, how their combs will brighten up, and how they will cackle. And Eggs! Why, a few days after you will be finding eggs all over the place—for COULSON'S NO. 3 POULTRY POWDER touches the spot and starts the magic flow.

Send for a small free sample of Coulson's No. 3 Condition Powder and also a circular telling you more about it. This COULSON'S NO. 3 CONDITION POWDER is prepared after our own PRIVATE FORMULA from especially selected ingredients, carefully and properly compounded, and the result is this powder is a GREAT HELP to the poultry.

"An ounce of prevention is worth a pound of cure," and a little of this No. 3 Condition Powder in the feed may save you many hens, and give you many more eggs. THE HENS NEED A TONIC to strengthen them. ONE CENT'S WORTH will do for twenty hens; one cupful, 5cWORTH, for one hundred laying hens. Get a package of this Coulson's No. 3 Powder; it will surely pay for itself.

The price is 15c per pound, but as a SPECIAL INDUCEMENT, and in order to convince you of its merits, we will send you 10 POUNDS FOR $1.50, EXPRESS PREPAID to your Station, or 25 pounds for $3.25. TRY IT; why not?

CALIFORNIA CULTIVATOR

A WEEKLY JOURNAL DEVOTED TO AGRICULTURE IN ALL ITS BRANCHES.

Vol. XXV—No. 23 LOS ANGELES, CAL., FRIDAY, DECEMBER 8, 1905 Subscription $1 a Year

State Poultry Exhibition at San Francisco

The old, forsaken postoffice was used for a fowl purpose last week. But it was the aristocracy of fowldom so it was permitted—even encouraged and enjoyed. The highest "roosters" were the Guinea hens which escaped during the first night and hied themselves among the large timbers near the roof. Occosionally they gave their shill warning and the whole show was an awful uproar from the roosters and hens taking up the alarm.

Excuse me, I didn't mean to say "roosters" for that proclaims me as unfamiliar with the breeders vernacular. I believe the only proper expression when referring to the male bird is cockerel or cock. So you see I'm not thoroughly "up" on poultry, however, this show looked good to me. I have seen bigger, but there were fine birds here.

There were said to be nearly 100 exhibitors with about 1,200 to 1,400 birds—not including pigeons of which there were about 800. The class with the largest number was the S. C. W. Leghorns, with 161 birds. Buff Orpingtons came second with 93; Barred Rocks third with 88; Light Brahmas fourth, with 80; White Wyandottes, 66; S. C. Brown Leghorns, 65; S. C. R. I. Reds, 56; White Rocks, 48; Buff Leghorns, 45; Black and White Minorcas tied with each showing 35, and so on down the Lakenvelders, of which there were three.

By the way, speaking of Lakenvelders, they were an awful disappointment to me. We had read much of their extreme beauty of feather—the glistening white body with interesting black tail and hackle or collar, the trim little body, etc. Well, their tails are not black, nor are their bodies white. The hens looks much like diminutive Light Brahmas, while the cocks approach a little closer to the "shadow on a sheet" appearance, yet there is no solid black in tail nor hackle, neither is there a solid white. They are small, hardly as large as the smaller strains of Leghorns and—well, they didn't suit me a little bit.

Regarding the other varieties, there were some fine specimens. I asked one of the judges, T. E. Orr of Beaver, Pa., who is secretary of the American Poultry Association, and was superintendent of poultry at St. Louis World's Fair, and withal a most genial gentleman by the way, and he told me that there were many fine birds here which would do credit to Madison Square Garden, or any other of the largest of poultry exhibitions. Especially did he comment on the high grade of White Wyandottes and Orpingtons, which classes he judged. One Buff Orpington cock he particularly referred to as the superior of any he had ever seen.

Geo. D. Holden, of Owatonna, Minn., and president of the American Poultry Association, was also unqualified in his praise of the quality of Pacific Coast poultry and of fine specimens on exhibition.

Geo. H. Burgott of Lawton Station, N. Y., called the world's greatest Leghorn judge, is another Eastern judge who came to give the coast the benefit of his experience. The only coast judge at work is Henry Berrar of San Jose, who also judged at St. Louis.

Speaking of the judges it may be perfectly in order to refer to one admirable feature. The call was for all exhibits to be placed on Friday and thus give time for all awards to be made and ribbons placed before the doors opened Monday morning, the 27th. That was not quite accomplished, but, by Tuesday morning practically all work was done and each exhibitor had the pleasure and profit, of all the rest of the week's work with his ribbons on his coops. This will be a strong card and was highly commended.

The water fowl exhibit was fair. Turkeys were not in it. Apparently all stayed at home to enjoy Thanksgiving, at least only ten braved the dangers of the week and came out.

Bantams made fair showing and a number of Peacock showed more gorgeous colors than their premium ribbons.

The stock or poultry supply and feed houses were not so largely represented as usual, but some fine displays were made.

The Petaluma Incubator Co. had a large exhibit of supplies and many incubators and brooders. Some incubators were filled and hatching which always draws an interested crowd.

Charles H. Lilly & Co. who are selling the Must Hatch had a large exhibit of machines with brooders filled with chicks.

The Jubilee Incubator Co. hatched some chicks and incidentally showed the merits of the Jubilee, some fine ones of which were shown, made at the big new factory at Sunnyside.

Geo. H. Croley, the pioneer supply man of San Francisco, had an exhibit in charge of Mr. Emerson. Foods and supplies largely. Mr. Prior of the Sturtevant Egg-Food Co., also in connection with Mr. Croley's display, had a line of goods.

The Cypress Incubator Co. and the Queen Incubator Co. also made exhibits which attracted many. C. B. M.

Scene at Petaluma, the White Leghorn City.

WOMEN AS SQUAB RAISERS.

There seems to be a great desire by women who read articles on squab raising to give the business a try. At least twenty-five per cent of all the letters we receive are from people who read squab matter and ask for more information and are women. If we were asked the question, says the Poultry Herald, "Could a woman manage a squab plant or not?" we would answer in the affirmative, for the real work of managing the business is not harder than the general house work and not so hard as it would be to run a poultry farm, and after glancing over the program of the routine work one could see why this is so.

Again if asked whether it would pay or not we could not answer the question as easily, for where it would pay one woman a handsome profit under favorable circumstances another who was not so favorably situated might fail to make the business a success. Much would depend on the disposition of the woman, for the returns from a squab plant are liable to come very slowly at first.

It would be advisable for most women to find out where they are to market their squabs and the probable express charges per dozen. One of the greatest drawbacks to a person just starting in this business would be the inability to furnish enough for each shipment. It would require one hundred pair of breeders to ship regularly one dozen per week, especially where the best are reserved to increase the flock, and up to that time the progress would be slow and perhaps discouraging to those unacquainted with the business and not knowing just what to expect.

It might be said that unless a person had sufficient room to accommodate from three hundred to five hundred pairs of breeders the business would hardly pay unless a local market be secured where squabs could be sold in any quantity from a pair up without being obliged to pay express charges.

A good pair of flying homers that will weigh two pounds per pair will cost from $2.00 to $3.00 per pair and no doubt the first two pair could be purchased for $5.00, but the breeders will never begrudge the money thus invested, for it must be remembered that the first birds purchased are to produce young to form the foundation for the future stock and the old saying, "Like begets like," is very true with pigeons.

Although the pigeons should be fed and watered regularly morning and afternoon, such a beginning as mentioned would require but very little time from the attendant for the first year. During this time any woman could easily judge whether she wished to continue in the business or give it up at the end of the year.

The work of ten pens would be the same as that of one only on the larger scale. The routine work in conducting a squab farm would be,

FARMERS' INSTITUTES.

Conductor J. B. Neff has arranged the following farmers' institutes for the month of December:

Brawley, December 11.
Holtville, December 12.
Imperial, December 13.
Calexico, December 15.
Compton, December 18-19.

Other institutes will be announced later.

CURRENT COMMENTS.

This is the month when our farmers' clubs should go into active operation. Get busy from this on, and make the next five months both interesting and instructive.

* * *

The farmers' club of Tropico will find a most beneficial helper in horticultural work and education in Prof. H. W. Myers, who has come to that growing locality from Nebraska, where for many years he was a valued educator.

* * *

Defense of Luther Burbank.—The Country Gentleman, in a recent issue, contained an editorial on Luther Burbank which is a criticism of the great specialist in that the claims put forward in his behalf are not bourne out by actual analysis and development. The San Francisco Chronicle is prompted to reply to this attack which it does in this stormy and fairly stated article which we quote in part herewith:

"The indiscriminate glorification of Luther Burbank, and the attributing to him of all manner of weird performances with plants, is said to be a source of great mortification to one of the most modest and painstaking scientists in the world. He has become a popular craze, and the state of mind which has taken possesion of a great many people in respect to Mr. Burbank has been called 'Burbankitis.' We are accustomed to think of the word 'creation' as meaning formed out of nothing. Certainly Mr. Burbank has done nothing of that kind. The use of the word, however, to indicate new forms or new characteristics by the intelligent employment of causes leading thereto is legitimate enough in a literary sense, but owing to the general popular conception of the meaning its use causes a rather unpleasant feeling in thoughtful men as savoring of the advertising methods of the charlatan, which Mr. Burbank most emphatically is not. What Mr. Burbank is, is a practical botanist and horticulturist of most remarkable skill, enthusiasm, judgment, persistence—and withal, modesty. His 'genius' satisfies the old definition of the art of taking infinite pains. By the exercise of these qualities for many years in the application of well known botanical principles and methods he has produced remarkable change of form in many plants. The commercial value of his work, aside from the pleasure given by his new flowers, is very uncertain.

* * *

"Mr. Burbank is to be respected as a worker in pure sicence, and not merely as the 'creator' of something which he sells, and it is a shame to picture him as the faker which the 'popular' writers would make him out to be. This defense of Mr. Burbank is prompted by the apearance of a book by W. S. Harwood, who seems to be an imable gentleman who knows nothing about his subject but has swallowed whole whatever he has heard and reproduces it amplified by a rather vivid imagination. The harm that such things do is the comment which they call out from discriminating men and journals of which the following are examples."

* * *

Football Tragedies.—It is high time the presidents of the State universities had a conference to make some rules to govern football playing in the future. The season which closed on Saturday recounts death from accidents double what it has been for a period covering five years. The record of injuries many of them of a permanent character, runs up to almost 300, a record certainly which calls for radical modification.

President Roosevelt has taken a hand in the game to the extent of urging upon college presidents the importance of making a compact to create a set of rules governing football playing or of preemptorily ordering its abandonment.. In Europe, where it is played under regulation, strictly, where 80,000 people witness a single game, no such disasters occur as are met in this country because the rules govern the players ahsolutely.

In the United States football is as brutal, and often fraught with as much fatality, as a Mexican hull fight. There is as much barbarism in one as in the other. The time has come to call a halt. If the presidents of the State universities cannot control the game, State Legislatures ought to.

A Needed Reform In Our High Schools.—A. Ross Hill, Dean of the Missouri Teachers' College, in an address recently delivered, says:

"Too often, I fear, the farmer boy who is fortunate enough to get into a high school, is likely to find that the subjects taught have little relation to his interests and needs, unless he has decided to abandon the farm and prepare himself for some profession like law or medicine. In fact, four years spent in a high school as courses are usually arranged may wean the boy away from the farm even if at the outset he entered simply with the view of increasing his intelligence and preparing himself in a general way for any sort of life work. This defect in present courses of study in the high schools can best be remedied by the introduction of courses in agriculture, horticulture and manual training, and by making them solid courses in the hands of a teacher who, in addition to good general scholarship, possesses a sound knowledge of the science of agriculture, or is himself proficient in the use of tools. Such courses could include the study of soils, of plant growth, horticulture, climatology and like subjects. These courses, besides containing much of general scientific value, would naturally lead pupils to an interest in related subjects that are alreay recognized in most high schools such as botany, chemistry and physical geography. Better general scholarship could thus be secured, while the boy would retain his interest in and sympathy with farm life. It is high time for us to put some reason and common sense into our courses of study, both in the grades and in the high school, instead of unconsciously and blindly following tradition, for some of the work now done has no other justification." This is the idea the Cultivator has been promulgating for the past three years.

* * *

The Isle of Pines Contention.—There are about two hundred former residents of California in the Isle of Pines. They are just now, in common with all other Americans strenuously insisting that the United States should take control of the islands. But Secretary Root denies the right of this government to interfere with Cuba in the management of the affairs of the Isle of Pines, and the "revolutionists" as the Americans are called are preparing to state their case to congress. There is a nice question to be determined in this contention. The Isle of Pines may or may not be included in the "other islands" which were ceded to the United States along with Porto Rico. The Platt amendment provided that the question whether the Isle of Pines belonged to Cuba or the United States should be left to future adjudication. Some Americans, taking the ground that the United States never gives up any territory it gets its hands on, went in and setled there in the full confidence that it would be annexed, but finding progress rather slow are now trying to help it along by kicking up a row. There are a number of former Iowans among the 1,400 Americans now in the Isle of Pines and they seem to be leaders in the attempt to set up a government of their own and repudiate the control of Cuba.

The "forty-four forty or fight" spirit has been a strong one in the United States heretofore. Land hunger has had its way willy nilly. When there has been any question of extending American territory and unfurling the flag in new possessions the American people have always been in the affirmative. Will it be any different now? It is said that the administration regards Cuba as entitled to possession pending the settlement of title and will do nothing to protect the American insurgents or keep them from being put down.

The Americans in the Isle of Pines all think they are on American soil. They went there with that understanding. It seems to be one of the "other islands" going with Porto Rico. In view of these facts and the well established temper of the people of this country in such matters, it would be well for Cuba to go slow and be especially careful in regard to shedding American blood. In that event even the magnanimous administration at Washington might be as little able to control the people as McKinley was to stave off the war with Spain after the Maine went down.

* * *

Clear Cut Message.—There has been no disappointment in the president's message to congress. It is clean cut and forceful. He reiterates his views on control of corporations, especially those which relate to railroads. He comes out clearly for "a square deal" for all interests, the producer, the carrier and the consumer. The matter is now distinctly up to congress and that body must henceforth assume the responsibility with the people. His declaration on the subject of class spirit, as it affects labor and capital, deserve careful consideration. His announcement that this government is not and never shall be government by a plutocracy. This government is not and never shall be government by a mob," was received with hearty applause by both houses of congress and will appeal to the country as the only doctrine on which can securely rest the foundation stones of this republic.

* * *

Farmers' Institutes.—We want to impress upon the farmers of the country the importance of attending the institutes which begin in Southern California this month. They are schools of instruction. Professors from the University will be on hand to deliver addresses, as well as specialists along civic and other lines.

Much real good can be derived from these institutes, a great deal of valuable instruction can be obtained. Take notebooks and write down, for future reference, the data furnished in the lectures. Besides the schooling which will be received a great deal of pleasure may be obtained in the social part of the meetings. Be sure to attend the institutes and bring the wife along.

We will be pleased to receive and publish notices of coming institutes in all parts of the state if the secretaries of same will kindly send them in. We would also appreciate receiving copies of papers read at such gatherings with a view to publishing them in whole or part when such papers treat of any subject in the broad field of agriculture.

* * *

The Congress.—The Fifty-ninth congress is in sesion at Washington. It will be one of the most eventful sessions of recent years, unless all signs go for nought. The control of railroad traffic is the paramount issue, closely followed by propositions to control life insurance companies by federal statutes. It looks as if all tariff legislation will be sidetracked.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

The fruit growers of California have been in sesison at Santa Rosa this week.

It is estimated that on the Hemet tract this year the crop of olives will reach nearly 200 tons.

Lawrence Wilson of Windsor will set out 160 acres of grape vines in Napa county this spring.

The first carload of Olives was shipped last week from Elsinore by J. R. White. They brought $65 per ton.

The Cloverdale Citrus Fair association is arranging for its annual fair in February, so says the Healdsburg Enterprise.

The Upland grape growers report a most profitable season. The output of table grapes for the season was over 40,000 tons.

The first car load of this season's crop of picked olives went East this week from the Bloomington section of the valley.—Citrograph.

R. H. Gilman of Anaheim has sold 10 1-2 cars of late Valencia oranges for $14,000. He expects to realize $20,000 for the season's crop.

Tomato growers at Fullerton are highly pleased at the outlook for their crop. The output is selling for $100 net a ton, in the Eastern market.

The Wetmore Brothers, near Stuart's Point, harvested this season 10,000 boxes of apples. Sonoma county is a wonderful apple growing section.

Prof. Ingham of the State university, is investigating pear blight in Tehama county. He ought to continue his investigations south of the Tehachapi.

Our Pajaro exchanges note that the prospect for apples in the Pajara valley is as good as it was last year. Thirty-five hundred car loads is the estimate at this time.

The Cultivator is in receipt of a specimen of seedless apples, resembling the Bellefleur, from Lemon Grove, San Diego county. The fruit is excellent in flavor.

The Vacaville Reporter chronicles the fact that grape buyers were wonderfully active this fall. Not half enough grapes were raised in the State to meet the demand.

Arthur Brooks of Highland, has sold his orange crop on eight acres, on the trees, for $2,500. This will net him, after all expenses have been paid 30 per cent. of the purchase price of the ranch.

The orange packing house of F. Schwan & Son, at Pomona, has been destroyed by fire, theb laze originating from a gasoline stove. The loss is estimated at about $5,000, with little insurance.

The Tulare Register boasts that "Tulare county has shipped 437 cars, so far of this year's crop of oranges," and adds "that is pretty near as many as all North California will ship during the entire season."

The California Promotion committee figures that California will ship more than 20,000,000 gallons of wine and brandy this year. That State produces, according to the committee's statement, 70 per cent. of all the grape wine.

The last of the walnuts of the Santa Ana Valley Walnut Growers' Association are being received at the local packing-house. Shipments for this year will aggregate forty cars, one-third less than for last year.

Prof. M. B. Waite, Orchard Pathologist of the United States Department of Agriculture, is in California again co-operating with Prof. R. E. Smith of the University Experiment Station in the war against the pear blight. At the Fruit Growers' Convention at Santa Rosa this week, both these experts will speak and will give their latest conclusions.

The Chino Champion says it is estimated that the olive crop at Moreno will be 100 tons, at Lakeview 50 tons, at Perris 50 tons, and at Elsinore 200 tons. These olives vary in price from $8 to $80, depending upon the size or quality of the olive and the conditions of the contract, as to whether picked and delivered or sold on the trees.

The Pomona Times says: "Thanksgiving" oranges have gone forward to the extent of many car loads. If we were required to eat any of such oranges, we don't think we could be thankful for a few weeks; but our Eastern customers demand them and pay tempting prices for them. Most Eastern customers now know that the early shipments of oranges are not ripe and lack the delicious flavor of oranges that are not picked till late in December or even late in January.

Valentine Peyton, owner of the 170-acre Evergreen ranch at Lordsburg, has commenced the erection of an independent packing house 60x100 feet. It is to be supplied with expensive machinery and will be one of the best packing houses in Southern California owned by one person.

I. Ford of Redlands has received a diploma for the exhibit of apples which he sent to the exposition and a letter saying that the medal would be forthcoming in a few days. The apples were grown on Mr. Ford's Oak Glen ranch and consisted of the Roman Beauty, Ben Davis, Winesap, Apple of Commerce and several other varieties.

AGRICULTURE.

The Orange Post reports the celery industry as very active at this time.

Santa Clara grain growers are putting in a larger acreage of small grain than in former years.

The Citrograph reports the temperature as two degrees below zero at Fredalba, 15 miles from Redlands.

The Agricultural Experiment station on the Chino ranch, has been finally closed as a station. It was established in 1890.

The Analy Standard has computed that 196 days passed this year when no rain fell. And yet all crops planted matured perfectly.

A. R. Sprague, a fruit shipper of Sacramento, has sued the Lindsay Gazette, so the Porterville Enterprise says, for criminal libel.

C. H. Roberts of Pasadena is making arrangements for planting 240 acres of tomatoes on the San Joaquin ranch the coming season.

Snow at Colton is so deep that the mountains and foothill roads are closed. From four to six feet of snow covers the country.

The Ventura Republican says: So scarce is wood becoming in the county that consumers are hauling it 15 and 20 miles and glad to get it at that.

Secretary Montgomery of the Los Nietos and Ranchito Walnut Growers' association, estimates that the output of walnuts will be 150 cars this season. Authority for this statement is the Whittier News.

The Anaheim Gazette reports the Los Alamitos sugar factory as having closed for the season. The output of three months and eighteen days' run was 122,000 bags of sugar of 100 pounds each.

Forty-seven thousand tons of beets were sliced. The number of men engaged was 190, working in two shifts. The total amount of money disbursed for labor, beets and material was $275,000. The season was one of the most successful in the history of the factory.

The Imperial Press says: "The government estimates forty acres of Arizona black ash trees to be worth $100,000 at ten years of age and that it is the most useful for all around purposes of any tree that can be planted in this desert."

Farmers' Institutes will be held during the month of December at the following places and dates: Thermal, Dec. 11; Brawley, Dec. 12; Holtville, Dec. 13; Imperial, Dec. 14; Calexico, Dec. 15; Compton, Dec. 18-19. At these Institutes professors from the University of California will deliver addresses on various subjects.

The Orange Post says: From five to seven 600-pound bales of chile peppers are being shipped out over the Southern Pacific daily to the Los Angeles and San Francisco markets and two carloads were also shipped over the Santa Fe the past few days. Growers report an active demand for the entire output, only a small part of which has been moved and they estimate that by February 1 the market selling price will be between 15 and 20 cents per pound.

It seems that a Sacramento firm or corporation went into the business of raising contaloupes in the Lindsay country quite extensively, and induced many of the resident farmers to do the same thing. Considerable feeling was aroused during the shipping season regarding returns from consignments, some of the ranchers claiming they were not given proper returns for their shipments. A. R. Sprague of Sacramento was the consignee of the greater part of these shipments.

LIVE STOCK.

William Pierson of Lindsay lost a fine barn and a team of valuable horses last week by fire.

A very serious outbreak of glanders has occurred aroung Kingman, Arizona. About thirty horses have been killed in that locality.

As Kingman is close to the State line, precautions have been taken to prevent the introduction of the disease into California.

Cattle and sheep in Mendocino county are looking better than at any time for years, despite the fact of no rain for over 100 days, until last week.

According to the Santa Maria Times a mutton famine exists in that locality, and the Times is yelling at the top of its voice, "Mutton, mutton, who's got our mutton?"

The Escondido Times says: J. H. Breedlove, Valley Center's largest individual rancher, will farm it on an extensive scale this fall and winter. Fine blooded stock will be extensively raised.

The cattlemen of Santa Cruz, San Benito, San Luis Obispo and Monterey counties have issued a call for a meeting for the purpose of organizing a State association, said meeting to be held in Salinas City on Thursday, December 21, 1905.

In the stock business, says the State Journal, "Nevada is coming to the front, not step by step, but by leaps and bounds, and the next few years will witness a growth and development, which, comparatively speaking, will be unequalled in the history of the country."

Fire last week on the Nicholl's ranch, on the Benicia road, several miles from Vallejo, destroyed the residence, two barns and a large amount of hay, entailing a loss of at least $5,000, which will be serious, for considerable stock is raised and kept on this ranch.

"The sheep-raising industry in Oregon is increasing with wonderful rapidity and wool is bringing high prices, giving the sheep owners big profits. Prices have doubled in the last twenty years, while the production of wool in Oregon is increasing at least 20 per cent. annually.

The board of supervisors of San Bernardino county has just passed an order for the preservation of the health of live stock in the county of San Bernardino, the eradication of infections or contagious diseases and the inspection of creameries, making it unlawful for any person to drive or move into or through the county any cattle unless accompanied by a certificate from a licensed veterinarian showing them to be free from glanders, farcy anthrax, Texas fever, verminous bronchitis, hog cholera, swine plague, scabbies, mange, or Texas fever tick.

MISCELLANEOUS.

The Pajorian says: The State Board of Horticulture has sent to the Watsonville Board of Trade a sample of the dreaded farm pest, the Russian thistle. As a rapid propagator this noxious weed easily takes the lead of all others and once established in any locality it is almost impossible to eradicate it.

WAIT A LITTLE LONGER.

For announcement of biggest cattle sale to be held in Southern California at De Lamo, (2 miles south of Compton) December 19th. 330 head of of cows and horses.—Briggs & Weber, Auctioneers.

MIXING FERTILIZERS.

The home mixing of fertilizers has been strongly recommended by all of the experiment stations for a number of years. The impression has gained credence that there is a chemical change which takes place after the simple ingredients have been mixed, that is essential to good fertilizers. It is also understood by the majority of farmers that the fertilizer agent knows best what is the proper thing for his particular piece of land. As a general thing, the best agents understand the principles of fertilization better than the average farmer, because they make a study of the subject it being their business, while the farmer knows or should know best, what his land require. There is a great incentive for manufacturers to recommend ready-mixed goods as the cost of mixing is greatly exceeded by the advanced price on the simple materials. There is also a claim by the manufacturers that when the mixed material is allowed to remain in a pile for a length of time it becomes "mellow" and is much more available, the acid added permeating the whole mass and acting upon the nitrates, potash and phosphates, bringing about this greater availability. All it can do is to make sulphates at the most and these can be more cheaply bought as "originals." A most thorough investigation has been made among the orange growers of Southern California and it was impossible to locate a single instance where data, such as cost of fertilizers, quality of fruit and weights from plots under different treatments would throw any light on the subject. Without such data not even approximate results can be estimated. On the other hand, after the experiment station in Pennsylvania has experimented for twelve years with phosphates both acidulated and unacidulated, it showed conclusively that untreated bone and even raw phosphate rock gave the best results as far as phosphates were concerned, but only where there was plenty of humus-forming material in the soil. This would go to show that phosphate from such sources would not be desirable for Southern California as a rule as our soils are mostly deficient in humus. However, should the orange growers continue to grow green crops as industriously as they are doing this year, there may be a possibility that such forms of phosphate as raw bone and raw rock will give the best results here also.

While the stations have recommended the home mixing of fertilizers they have not always given general principles to be observed. We give them here for the benefit of those interested.

Superphosphate should never be mixed with Thomas slag, lime, Thomas slag with ammonium sulphate or barnyard manure, nor lime with ammonium sulphate or barnyard manure.

Those that may be mixed but must be used immediately are as follows: Lime nor Thomas phosphate, with Kainit, sodium nitrate or potash salts.

Those which may be mixed and left indefinitely before using are as follows: Superphosphate with barnyard manure or guano, Kainit, nitrate of soda, potash salts or ammonium sulphate, lime with Thomas slag, ammonium sulphate with barnyard manure or guano, Kainit, nitrate of soda, or potash salts, barnyard manure or guano with potash salts and Kainit, potash salts with Kainit, and nitrate of soda with potash salts or Kainit.

A few of the reasons why certain mixtures should be avoided are as follows: Nitrate of soda when mixed with barnyard manure loses its nitrogen as nitrogen gas when fermentation of the manure takes place. The same thing happens when lime and stable manure are mixed. When superphosphate is mixed with lime or Thomas slag, the phosphoric acid becomes less available. Potash salts and slag are liable to harden and form lumps which make them hard to distribute.

NITRATE OF SODA FOR FRUIT TREES.

An illustrated German bulletin gives an account of the increased yield of cherries and apples secured when nitrate of soda was used as a fertilizer.

Illustrations are given which show graphically the difference in yield when this fertilizer was employed and when it was omitted. The author has applied as much as 50 pounds per acre without injurious results. Injury to fruit trees through overfertilizing with nitrate of soda first shows itself in the youngest shoots, which turn brown, wrinkle up, and look as though they were burned.

As a result of ten years' experience in the use of this fertilizer in connection with potash and phosphoric acid fertilizers the author holds that not only is the nitrate beneficial and profitable, but for those who would secure the greatest returns it is indispensable.

OLIVES.

Ripe California canned olives are growing more and more in favor. There is no danger of their spoiling like olives in kegs or barrels. The grocer and consumer are both satisfied with their purchases and the increased demand for high-grade goods is sufficient indication of what the future has in store for this article. Many of the leading pickling concerns have learned how to put up green olives so that they will keep for a period of two years or even longer, so that one of the great obstacles in the path of the olive pickling business has been removed.

Pure California Olive Oil is also becoming more and more appreciated by the trade. They are beginning to realize that California producers take a pride in putting up an article which is pure, and in keeping up the standard of what they send out. Such varieties as Manzanillo, Mission, Obliza, Ascolano and Sevillano are the standards for pickling purposes. In oil varieties Rubra, Columella, Nevadillo, Blanco and Pendulina are the standard sorts.

IT'S PENNY WISE

Economical Spraying

Power Sprayers do the work **quicker,** do it **better** and do it **cheaper**—that is, if you buy the right kind. Some people think an engine hitched to a hand spray pump makes a Power Sprayer, but it is more likely to make a "Peck of Trouble."

Bean Power Sprayers

embody the practical experience of the best growers and contains scores of important details which are absolutely necessary for rapid, thorough work without annoying delays. You know that little things are what cause delays and expense, and it is all such points that five years of experience have eradicated from the **Bean Power Sprayer.**

Every **Bean** outfit is sent out complete, ready for work. Nothing left to fix up. No further supplies needed. It is complete and so simple that no previous experience is required for operating.

How the **pressure** is **kept constantly even,** the **liquid always stirred,** and why **spraying** can be **done for one-half the cost** of hand pump work, are all questions we shall be pleased to answer.

Write to-day for our free illustrated catalogue No. 18, which gives all particulars. State number of acres and kind of fruit. (Catalogue No. 16 describes hand pumps.)

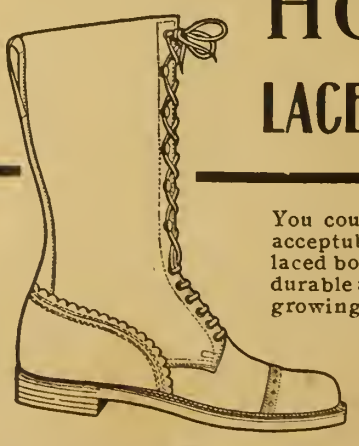
A PAIR OF

HOEGEES'

LACED BOOTS for a Christmas Gift!



$ 3.50
5.00
6.50
10.00

You could hardly think of anything more acceptable to the outdoor young man. These laced boots are being made handsomer, more durable and comfortable all the time and are growing in popularity wonderfully fast. We have them in various styles, heights and many kinds of finish from black down through the various shades of tan to pure white; also in variously tinted buckskin effects—some of which look delicious enough to be served on the table. All joking aside, these boots are really works of art, both as to looks and construction; being made over the best lasts and reinforced and made wearproof and waterproof as far as human ingenuity goes in that direction. A pair coming down the pike, with their jaunty lacings of white rawhide, and the pride-of-the-family safely planted inside, is a sight to see.

Send for our outfitting catalogue at once and read carefully.

CITRUS FRUITS

SAWDUST IN ORCHARDS.

Editor Cultivator: In a November number of the Cultivator an article under the heading, "best material for bedding to keep animals clean and absorb the greatest amount of liquid manure," three kinds of bedding are mentioned, straw, sawdust and shavings. Across the street from my orange grove is a planing mill where I can get shavings and dust for drawing them away but I have not done so from the fact that an article appeared in the Cultivator the past summer written by a man, I think near Pasadena, giving his experience with shavings and sawdust on his citrus orchard, to the effect that it was ruinous to the trees. Would be thankful for your opinion on this point in the next issue of the Cultivator. W. D. C., Colton.

In answer to the above I would say as to personal experience that two years ago I applied fifteen large loads of fine shavings and sawdust to about three-quarters of an acre of heavy soil in orange orchard. The shavings were plowed in with the effect on the soil to make it readily absorb the irrigation water during the summer following the application, but this year it had no perceptible effect. The quantity applied had no injurious effect on the trees. It had no lasting effect in loosening the heavy soil, and under the circumstances I did not believe it paid, as I had to haul the material two miles.

Shavings and sawdust have been applied to orange orchards in the vicinity of Pasadena and I have heard of only one case where the orchardist thought it injured the orange trees.

I have one case in mind of an orange orchard where a large amount of this material from the mills was applied to the surface, the orchard not being plowed, only cultivated. The owner has been applying shavings and sawdust to this orchard for three years past and is continuing to do so at the present time. The soil is a heavy one. The mulch of shavings and sawdust aids in catching and holding the rainfall and to some extent prevents evaporation and the amount of irrigation water used has been materially cut down.

There is apparently no injurous effect on the trees and there is a fair growth of new wood for this year. The crop of fruit last year was not a large one and this year the crop is light.

I believe in this case better results would have been obtained if the orchard had been plowed and the material thoroughly mixed with the soil to a depth of eight inches. This would have loosened up the soil. I certainly do not favor a mulch of any material on the surface of the ground but rather mixing of the woody or vegetable material used with the soil to some depth, to render the soil loose and porous. I do not believe sawdust or shavings would be beneficial to a light porous soil. Of course every one knows that sawdust has no fertilizing material in itself and is only beneficial in making heavy soils loose and porous, admitting the air and water and thus aiding in rendering available the natural elements of fertility already in the soil.

I should prefer the use of stable manure, or peas as a cover crop, plowed under to improve the condition of heavy soils as it not only improves the physical condition but adds necessary plant food.

Apolving of Fertilizer to Citrus Orchards.—A novel experiment is being made in the application of sewage to a thirty-acre orange orchard just south of the city of Pasadena and on the outfall sewer. The sewage is pumped at a small expense from the sewer and is used to irrigate the orchard.

The time of applying the fertilizer s important as I have shown in former articles in the case of forcing lemons into bloom at the right time and to aid in the setting of the orange crop. The effect of fertilizer applied this fall, winter and next spring will be apparent next summer in the growth of new wood and the greatest benefit in increasing the fruit crop, will come the year following. It is economy to apply fertilizer every year in a not too excessive quantity. Spasmodic applications in large quantities are not to be recommended. The object sought is by regular applications to constantly feed and keep the trees in a vigorous fruitful condition.

* * *

Effect of Different Fertilizers.—Some orchardists are strong advocates of stable manure while others as strongly support and recommend the use of commercial fertilizers. Both, in my opinion, are good when rightly used, and the combination of stable manure and commercial fertilizers is, in my opinion, the ideal method. Too much stable manure lowers the quality of the orange but in the right quantities greatly aids in improving the physical condition of the soil. One orange grower who has experimented largely, says that guano has the effect of early ripening of the orange. The first experiment with guano was a strip through the orchard, showing a decided effect upon the fruit in its early coloring. The next year guano was applied to the whole orchard, ten acres, with the result of early coloring and ripening of the fruit. If it is true that guano hastens the ripening of oranges, those sections that grow oranges for the early or holiday market would be benefited by the use of guano. It is a matter well worth inquiring into by the orange growers of Central California.

* * *

Home-Made Fertilizer.—Fertilizers, whether stable manure or commercial are expensive when they have to be bought, and as a result many citrus orchards fail to get the annual dressing required to keep them in good fruiting condition.

On the small orange ranch there is a good opportunity to increase the home supply and cut down the bills for outside fertilizers. The first source of increase of home-made fertilizer is the saving of all the liquid manure by using absorbent bedding for the stock kept on the place. Straw, sawdust, weeds, leaves and sand can be used for this purpose. As an instance I call to mind a New England farm near a manufacturing city, where a dairy was kept. The barn was an old-fashioned side-hill structure with a manure cellar. The cows were stabled at night through the summer fine sand was used for bedding and as an absorbent of the liquid manure. In the cellar, with cement bottom, was kept a few head of swine. Grain was scattered on the compost and the swine were utilized in rooting over and mixing the material in the cellar. The cellar was filled three times a year with the manure and bedding of sand. The manure was used in growing corn and on the meadows. The final result was to increase the fertility of the farming land to the highest possible degree. The meadow lands (river flats) produced three crops of hay, the last a light crop or rowen. This shows what may be done under methods of intensive culture. With the present high price of fowls, eggs and dairy products in Southern California the citrus fruit grower might not only add to the income of the fruit farm, but largely increase the amount of fertilizer produced on the farm by keeping a good stock of fowls and a few cows. It is a well know fact that the fertilizer from the chicken houses is one of the most valuable. This matter at first may seem a small one but will be found in the sum total an important adjunct to the citrus fruit farm. If in connection with the home supply of fertilizer, we should utilize the leguminous cover crops as a source of fertility we will have found a solution for the fertilizer problem and the maintaining of citrus orchards in the highest degree of fertility and fruitfulness.

BEES AND HONEY IN EUROPE.

I think that I havc already called the attention of our readers to the fact that while there are many colonies of bees in Europe—more in number and more widely distributed than in America—yet there are not many largc apiaries. It is the want of many to keep and care for a few colonies, each person hoping to secure a little addition to his income and supplying the family needs rather than his livelihood from them. This, of course, prevents the rapid progress in methods and management. The improved hives, sections, and elegant preparation of the honey for market is largely absent in Europe. I saw little honey exhibited for sale,, and that was put up in a way that recalled American methods at least thirty years ago. In a very few cases did I see honey in sections, as we see it so generally in our own country. In France, Belgium, Holland, and Germany, while honey seems not very much in evidence, when it is seen it is almost invariably in bulk—the combs cut out, and almost never in the neat sections that are so attractive in the markets of the United States.

I have also been surprised to find how rarely honey is served in hotels and restaurants. I have repeatedly called for it to receive the reply that there was none. When I see it in the stores, even though it is in form that would not be tolerated at all in our grocery stores at home, and inquire the price, I am surprised to find in England and Scotland that one must pay a shilling (25 cents) per pound; in Paris and Belgium, a franc or more, and in Germany a mark. So we see the price in Europe runs about the same, and is very high. Few people here have incomes so that they could afford to buy honey except in very small quantities and at long intervals. The rich would not buy very much for they would not wish it in such ugly, crude form as it is handled in these markets. Does not this show that we may hope for a good market for honey on this side of thc sea when it is once worked up? I believe honey can bc produced in America at a good profit at 6 cents per pound for the same quality of comb. When our marketing machinery is so adjusted that we can market direct through the aid of our own associations, with no call upon the middlc men, I believe we can market the honey here in much better shape than it is handled now, and can at the same time shave the price. Today the best fruit here, fresh and preserved, comes from California and other parts of the United States. True the pricc ranges high, but there is a call for it and it sells. Of course fruit, as a perishable commodity, must sell very high when it sells so far from the place of its production, and yet it is here. Honey is not perishable, and so possesses great advantage. I see no reason why American honey as well as American fruit may not find in the future a greatly extended foreign market, and at prices that will shade those of today, and the article be much superior to most now sold. This will not only benefit our own producers but it will also be a Godsend to. the consumer here, who, at present, for the most part must deny himself these luxuries however much he may yearn for delectable sweets and fruits.

* * *

SUGAR HONEY.

A correspondent asks me why I do not continue feeding the best grades of sugar for honey; not merely for food for the bees to keep them from starvation in case they have a meager supply of honev or stores, but for honey to sell. He says the past season was one of honey dearth from flowers. He thought to see what could be done by feeding sugar. He fed only a good quality of sugar, and has secured a very excellent quality of honey and at a reasonable profit. He says he will practice this much more extensively in future. He says: "This is honey, not stored sugar syrup. Any one who tastes it and pronounces it other than hon y should be provided with a guardian.".

Fifteen years ago I carried on some experiments. I fed a strong colony of bees nearly 20 pounds, as I remember, of sugar syrup made from the best granulated sugar. I fed this just at even tide, and found that all was stored in the combs the next morning. I extracted some of this the next morning and then waited for the remainder to be capped over. I had both samples analized by three of the best chemists in the United States—one the Government chemist. They also analyzed the syrup. The analysis: they all pronounced the syrup as pure cane sugar, and the honey as mostly reducing sugar, though the percentage of reducing sugar in the sample from the comb that was capped over was much more than in that extracted the morning after the feeding was done. I wish to add that the honey was honey, not stored sugar syrup. I had it sampled by several people, some of them bee keepers of ability and wide experience. All said it was good honey and very excellent in flavor. I will say that it certainly was honey, and I am sure would rank with the best. The nectar of flowers is also cane sugar like that of our kitchens. The bees, in the digestive process, as they store this, change it from cane to glucose sugar. There is always a little cane sugar that is not reduced. In these samples there was more in the honey taken at once. This shows that digestion goes on after the bees store the honey. It would be interesting to know whether the bees take this again into their honey stomachs or whether they add more digestive ferment to the honey after it is stored. Surely in this case disgestion was not completed, for the honey changed not a little after the first day. Honey owes its peculiar flavor, first to the fact that it is honey or digested sugar. This flavor will be common to all honey and will make the experienced able to pronounce upon the market. Then there will also be a flavor consequent upon the essential oils of the nectar. If there is very little flavoring material in the nectar, as in the case of white clover, then the honey will be very mild and delicate of flavor. Linden for like reasons will be more pungent, and buck wheat quite rank in flavor.

I take issue decidedly with several as to the definition of honey. I say emphatically that honey is liquid sugar stored by bees in their combs. We cannot give the source. It will usually be from floral nectar. We can never say surely that it will be. It may be from honey dew; it may be from stolen honey; it may be from sugar taken from some near by grocery, as we can never know the source of the nectar that gives the honey, so we can never make the source a part of any practical definition. These then are facts: 1st, honey is digested cane suggar, unless it comes from honey dew, in which case it needs no digestion; 2nd, the stored product of bees is honey whatever its source; 3rd, honey from sugar syrup is not only honey, but it is very excellent honey; 4th, the digestion or change from nectar to honey is not completed when the honey is stored, but continues for days, possibly till it is capped over and maybe even later. We see then why cured or well refined honey may be superior to others.

And now I am ready to answer the correspondents question. I have not continued to urge or even to suggest feeding sugar syrup for honey, because many bee keepers were loud in their protests against even such a hint or suggestion. They said it would be selling sugar, not honey. This, from what has been said, we see is not true. They further argued that it would subject the industry to suspicion , to just criticism, and to inquiry. I believe this also a mistake. What is really true, honest and scientific need scare no one. I believe such timidity was unnecessary and uncalled for, and not a mark of wide vision and good sense.

Again I am not sure that such honey can be produced at a profit, but I believe it could, and it seems our correspondent has proved that it can. Because I felt that such honey would be costly, possibly too costly to sell at a profit, and more because of the scare among bee keepers. Because of these suggestions and these facts I have kept still, though not without mental protest. I believe in all such cases we do wisest when we hew to the line of exact truth, let the chips fly wheresoever they may. Were I a bee keeper I should not hesitate to feed sugar for honey, nor would I refrain from selling the product as honey, nor would I fail to denominate it as excellent honey. And if I found it was produced at a profit I should feed largely of this bee food, just as I would feed my cattle for butter and cheese. So too would I feed my bees for honey. Any howl from nervous, timid souls would not harm me nor the industry. People will always buy a good thing, and good honey will never go begging. Surely any one who eats oysters—here the entire animal goes down—and wishes more, would never scowl at so clean and wholesome a product as sugar syrup honey.

In Actual Use

Keen Kutter Quality tells in the actual use of the tool. Keen Kutter Tools are not retired by an occasional knot or tough piece of material. They are made to stand hard work and lots of it. They are as good as new after poor tools have gone to the scrap heap. The

KEEN KUTTER

brand covers a complete line of tools. In buying any kind of tool just see that the name Keen Kutter is on it and you have assurance of full satisfactiou. Keen Kutter Tools have been Standard of America for 36 years and are the best that brains, money and skill can produce.

Some of the kinds of Keen Kutter Tools are: Axes, Hammers, Hatchets, Chisels, Screw Drivers, Auger Bits, Files, Planes, Draw Knives, Saws, Scythes, Tinners' Snips, Scissors, Shears, Razors, etc., and Knives of all kinds. If your dealer does not keep Keen Kutter Tools, write us and learn where to get them. Every Keen Kutter Tool is sold under this Mark and Motto:

"The Recollection of Quality Remains Long After the Price is Forgotten."

THE VALUE OF QUALITY
When you are considering the purchase of a wagon, buggy, harness, farm or dairy implement, always bear in mind that we have what you want and of the very best quality at the right price.

DON'T THINK
that you save any money in buying an inferior article. A poor wagon will cost nearly as much as a good one and the repairs necessary to keep it in good running order are very expensive.

BUY THE BEST
and you will be better satisfied and have longer wear at less expense than in the purchase of a cheap, thrown-together trap. We carry only such goods as we can recommend to be of first-class construction.

OUR POLICY
of giving full value has been adhered to since beginning business nineteen years ago. We have constantly increased our stock and now have a complete line to offer our customers.

CALL AND SEE US

What a College Farm Is For

Prof. L. H. Bailey, Dean of the College of Agriculture at Cornell, recently gave a talk on the above subject. After some remarks about the purposes of such a farm as stated by various parties, and somewhat of the history of college farms in general, he finishes in the following words:

"It seems to me that we have now come to the final proper stage or idea—that the college or university farm must be a laboratory. The pattern farm, model farm, commercial farm and illustration farm are all incidental and secondary to this general purpose. A college farm is not primarily for the growing of profitable or model crops. I should rather have the opportunity to teach one student by means of a farm than merely to show one hundred persons a field of perfect corn or pumpkins. If we are to study principles of plowing in the class room, we must also study them in the field, even if we are obliged to destroy the crop. We must determine and test the relations of plowing and germination aeration, microbic life and other questions of vital importance. If both ends cannot be attained, it is more important that a man learn how and why to plow than it is for the college farm merely to grow a good crop of wheat. Even if I were obliged to tear up the drains on a farm in order to teach proper drainage of the land I should want the privilege of doing so. The botanist pulls up the plant in order to study it. In learning how to grow potatoes we may need to pull them up to study the root system even though we destroy the potatoes in doing so. I do not see how an orchard can be a "model" if it is used as a means of teaching students how to graft and prune. The stock judging pavillion that is to be a part of our agricultural compound is to be so arranged that the stock can be led or driven into it, as is done in other agricultural colleges. The cow, the sheep, the pig, will be used as a laboratory material. The students will study real live cattle, not pictures and models. They will endeavor to find out why cows are good or bad for this purpose or that. They will examine for conformation. These cows are just as much laboratory material as the plants of the botanist or the chemicals of the chemist. Students will study cattle in the same spirit that students in geology study the stratification in rocks. Of course we shall need to keep the stock for the purpose of securing milk to be used in the dairy laboratory.

The milk then becomes laboratory material and the cows which produce it may also still be used for instructional purposes. In other words, the value of a college or university farm from a teacher's point of view lies in its usefulness as a means of teaching. You may not think of such an area as a farm; if the terminology troubles you, then call it land or field laboratory.

Agricultural education now rests upon an enlarged and quickened idea of the laboratory, or actual touch with objects, phenomena and forces. We are introducing laboratory methods into all kinds of schools; the kindergarten, manual training, school-garden, nature study and science work, all mean laboratory method. And now we also introduce the affairs of everyday life into the schools. All laboratories are pedagogically valuable in proportion as they are in vital connection with theoretical instructions. No school, whether in New York or elsewhere, from the primary school to the university, is a good school unless it has laboratory work. The effort is now being made to introduce into every high school in New York a year's work in biology for the first year; and the recent syllabus allows this to be followed, in the second year, with work in agriculture.

It will never be possible to systematize and to schedule laboratory work on a farm as explicitly as under cover because of the uncertainties of the weather and the distances involved. Therefore, indoor laboratory work will always be necessary in agricultural teaching; but the indoor work should be looked on as a supplement to the outdoor work.

I do not pretend to say that we have developed a perfect utilization of our own farms as laboratories, but we are working toward that end. The farms need much improvement and equipment. Parts of our farms are being used for experimental or research purposes. Incidentally these areas also, become of value to students, but primarily they are investigational rather than educational. I am speaking now of farms that are to be utilized for pedagogical work rather than for investigational work. As such, we want land that we can use when we choose and as the necessities of the case demand. I am asked whether, then, college farms should not be used for the growing of maximum crops. I reply that a college farm is a means to an end; the end is the teaching of students; the growing of maximum crops may or may not be the best way of attaining this end. We hope to conduct our farms on the best business principles and in conformity with the very best farm practices; we expect to make them interesting and attractive to students and visitors; nevertheless the laboratory utilization of these areas is to be our first consideration. If we are not using farms as a means of training men, then we are not using them for pedagogical purposes, and the future will not justify our possession of them. For myself, I would rather have ten acres of land to use when I want it and as I want it than to have any number of acres to look at and admire.

RED CLOVER AT LONG BEACH.

Samuel Brown of Long Beach asks if red clover will do well on the south slope of Signal Hill; if not what will. Red clover is not a California plant. Like crimson clover it will not do well in our State. Alfalfa is pecularly adapted to our soils, climate and conditions. It surely will do exceedingly well if it be given plenty of water. It is a great water thief, and one must be sure of a good water supply if he is to grow this plant. In all the region of Long Beach there will be artesian water after the latter fails farther up the valleys. There is another reason for planting alfalfa. The demand will always exceed the supply, so we may rest assured of a good market at splendid prices.

TREES

CALIMYRNA FIG
There are a great many sorts of Smyrna Figs. We catalogue six kinds, but these do not comprise our entire collection. There is only one variety, however, which five years production on a commercial scale warrants us in recommending it for drying purposes, and this particular variety we have designated as above to give it the distinction it deserves. When you buy your trees from us, you know you are purchasing stock originating from pedigreed trees, which have been producing the highest grade of fruit for a period of years. When you purchase a thousand peach trees, you usually designate what you want. You certainly would not permit your nurseryman to send you a lot of varieties, without labeling them, if you could help it. Well, it is the same with the Smyrna fig, some are early, others late, some are purple, others green. Can you afford for the sake of saving a few cents to take chances on buying trees, which cannot be relied on. We were the first ones to demonstrate the value of this fig, and with our seal we guarantee the genuineness of our trees. Prices lower than ever before.

FRUIT TREES
Are grown on a deep, alluvial river bottom, virgin soil, consequently the root system is as perfect as good soil can make them. Our assortment of apples, pears, peaches, prunes, apricots is more complete than ever.

ORANGES AND LEMONS
Our stock is grown in Exeter, the famous thermal belt of Tulare County. The soil is a rich, deep, black loam, just the kind which develops the highest grade of fruit, as well as the most perfect type of tree. Our assortment consists of all standard varieties of Oranges, Lemons, Pomelos, Citrons, Limes, etc. Carrying out the lines already established in the other branches, we do not confine ourselves to one or two standards and no more, for although it costs money to keep up a stock of many varieties, we want to be on top in this, as well as in everything we specialize in the nursery business.

GRAPE VINES
If you do not know it, you ought to know that we are the largest growers of vines on the Pacific Coast. We are not only growers of raisin, wine and table grapes, but we are also making a specialty of vines grafted on Phylloxera resistant roots. Our great and enterprising neighbor, Mexico, is having its vineyards devastated by this pest, and we have already sold two orders to prominent vineyardists there, who know what our stock is, consisting of eighty thousand grafted vines. How did we get such orders? Because we had pleased our customers before, so they had no hesitation in patronizing us again.

ORNAMENTAL STOCK
Our stock of Texas Umbrella trees branched in all sizes, guaranteed absolutely true to name, is better than ever. We are extensive growers of Poplars, Mulberries, Maples, and all deciduous ornamental trees suited to our conditions.
In evergreens, we have Acacias, Eucalyptus, Palms, Roses, Greenhouse plants, in fact everything you want for your garden.

OUR NURSERIES
Eleven hundred acres in four distinct places. Expensive to run a business so widely distributed. We konw it. Why do we not concentrate all in one place? Because we want to be in the position to grow the best of everything, and to do this, must select the soil to suit the tree, shruh or vine. No use to grow a tree where you know beforehand the conditions are not favorable for its perfect development. That is what twenty-one years of experience does. It places us in the position to grow the very best stock. In making a plea for your trade, we do so, not because we have the cheapest stock, but on the ground that when you favor us with your business, you will get the best which money, brains and experience combined can grow.

CATALOGUE
We will mail our large profusely illustrated Catalogue, English or Spanish, to any address on receipt of 5c postage. Price-list mailed on application.

PAID-UP CAPITAL, $200,000.00.

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

A SEASONABLE HINT.

As the planting season returns the needs of our gardens become again a matter of important consideration. We wish to make our homes attractive, and realize our many mistakes; many plants, according to the great law of nature, "the survival of the fittest," have died out. This law means to us that plants succeed with least care and attention when they come from countries with light rainfall and dry summers and existed under climatic conditions similar to those of California. It is always of special interest to visit a badly cared for or deserted place. If we see some bright spot of color, something doing well, we ought to make a special note of it for future use, for only in this way may we come to know those plants which, in our State, will virtually care for themselves.

THE GARDEN ACACIAS.

No garden in California will be complete with out a selected group of acacias; for smaller gardens those of medium growth are best. We must also avoid kinds that are like our common A. floribunda, residents of river banks, which will demonstrate their unfitness by leaving unsightly gaps in our shrubberies. Acacia cultriformis and its more robust ally, A. pravissima, are very beautiful. Acacia macradenia and A. homalophylla are valuable, blooming early, from December to March. A bare list would mean little, but your collection should include A. saligna, A. Baileyana, A. pycnantha of the robust growing kinds; and for the foregrounds A. obliqua. A. cultriformis, A. centis, A. salicifolia, A. diffusa, kept headed down to about three feet.

FLOWERING SHRUBS.

A group of spring flowering shrubs of especial merit are the genistas and cytisi, interspersed with various other beautiful members of the pea family; of these not the least attractive is the old-fashioned broom (Spartium junceum), blooming almost continuously. Among the cytisi are many coming from Spain, with white and yellow fragrant flowers, especially the white forms, known in Europe as Spanish broom. The Genistas also give many very attractive plants, but from the prevalence of yellow and white flowers, if we want variety, we may use a few plants of Polygalas, especially P. apopetata and the charming little Hardenbergia which makes a climber as well as an attractive shrub with purple and blue flowers. A specimen of the Cassias or buttercup, if only for its free flowering habit, should be included in this list.

DAHLIA ROOTS.

Dahlia bulbs (so-called) will soon have to be taken up and stored away for next season. In this climate, it is not absolutely necessary, but is much better than to leave them in the ground, as they take up room that can be utilized for other flowers during the winter season. When taking them up cut the stalks down to within one foot of the ground and store away in some dry sand in the cellar or other dry place. It will be a step in the right direction to label them as to color and height, providing you have not the names of the different varieties, as they can then be planted next season with a better idea of harmonizing their colors and growth.

SHRUB PRUNING.

Shrubs such as spireas, deutzias, philadelphus, weigelia, etc., should not be pruned at this season of the year. It is a mistake made by a great many and should be remedied. When they flower in the spring, it is along the full extent of the branches, and if pruned at this season it takes away the graceful effect that is so essential to their beauty. The proper time to prune them is immediately after flowering, which gives them a chance to make a good growth of flowering wood for another season.

BULB PLANTING.

This is the best time to plant Dutch hyacinths. They do equally as well in the shade as in the full sun. A good rich loamy soil is best, and it is a good idea to have a handful of sharp sand under each bulb as they will start root action better. The same may be said of the lilies: Harrisii, longiflorum, candidum, and auratum, which should be planted at once. Plant the hyacinth about three inches deep and mulch the bed well, but do not use fresh manure around the bulbs. Treat lilies in the same way, only plant them five inches deep.

Among the most satisfactory bulbs for spring bloom are anemones, ranunculus, sparaxis and ixias.

Plant the anemones and ranunculus from one to two inches deep, and the sparaxis and ixias an inch. A very successful way to grow anemones and ranunculus is to soak the bulbs a few hours and then pot them in two and one-half or three inch pots, according to the size of the bulbs, and put them away in a moist shady place until they show through the ground, when they should be given full sunlight, and in about five of six weeks they will be ready to plant out where they are to bloom.

The above way of growing them is a great advantage where room in the garden is at present occupied with other flowering stuff that can be removed when its season is over and these bulbs substituted. Ixias and sparaxis can be treated in the same way, but you should put three bulbs in a three-inch pot or five bulbs in a four-inch pot, and they should have the root well developed before being transplanted and disturbed as little as possible.

HARDY ORNAMENTALS.

The New Mexico Agricultural Experimental Station reports on a few ornamentals tried at Mesilla Park. Plants which will endure in that climate will grow anywhere in California. The report says: "Monterey Cypress (Cupressus macrocarpa) is a large growing evergreen with a yellowish cast and a broad pyramidal growth. The leaves give off an agreeable odor when they are touched.

Italian Cypress (Cupressus sempervirens var. fastigiata). This is a tall tapering evergreen with the side branches growing parallel to the central stem. It has a dark green and rough foliage. This is a very desirable tree for cemeteries.

The Trailing Juniper (Juniperus Sabina, var. prostrata) is a low spreading evergreen with a bluish green foliage and procumbent branches furnished with short spiny pointed leaves. It has a noticeable and agreeable odor. The Juniper is well adapted for single or mound work.

These three evergreens are giving good results and seem to be well adapted to this climate. Specimens of the two species of the cypress planted in the spring of 1903 are now from three to four feet in height. These can be propagated from seed, but where only a few specimens are wanted it is better to zet small trees already started.

San Luis Obispo County Lands. Best and Cheapest in the State. Rainfall abundant. Colony Lots, Farms, Orchards, Stock Ranches, Town Lots, Business Openings, Mines. Offices opposite R. R. Depots, Oceano and Arroyo Grande, Cal. Call or write for price list.—Beckett Realty Co.

In the Vegetable Garden

DECEMBER VEGETABLE CALENDAR.

The following vegetables may be planted this month: Beets, cabbage, carrot, cauliflower, lettuce, onion, pea, rhubarb, and spinach.

GARDEN FERTILIZERS.

The question of fertilizers is a broad one, especially for the garden where one plant needs much, another little, others none at all, while certain plants demand a special fertilizer. In regard to their value in making a stiff or "adobe" soil friable, a more or less strawy horse manure is to be preferred.

In such soils cow manure, unless very old, makes a bad matter worse. Cow manure will be found especially valuable on sandy or gravelly soils, though such soils will generally "digest" any amount of any stable manure. Certain it is that stable manures of all kinds, if well rotted, are preferable for garden work to any other class of fertilizer.

Prof. L. H. Bailey, writing in Country Life in America, March, 1903, says: "Of all the single commercial plant-food materials I suppose gardeners tie most to bone flour (when it can be secured). This contains both nitrogen and phosphoric acid. Potash is often applied in the form of unleached wood ashes. For myself I always like to have on hand a bag of nitrate of soda for nitrogen, one of muriate of potash and one of dissolved South Carolina Rock for phosphoric acid. These I apply separately in the garden as I think the plants need—one soon learns about how to use them.

One must be careful in the use of bone flour, it is a very powerful fertilizer.

ONION EXPERIMENTS IN TEXAS.

With this crop the seed was sown in beds and the onions transplanted to the field when they had attained suitable size. Thrips, which seriously affected the onions in the seed bed, were kept under control by spraying with whale-oil soap used at the rate of 2 lbs. dissolved in 6 gallons of water. At setting out time the tops of the onions were trimmed to about 5 inches and the roots cut back to about 0.75 inch. Eight cultivations were given. In addition the unirrigated plat received one hoeing.

Level cultivation was practiced and at no time was it deeper than 1½ inches. The irrigated plat received 4 irrigations in addition to the preparatory one which was given to both irrigated and unirrigated plats alike. A mixed fertilizer containing 5 per cent nitrogen, 6 per cent phosphoric acid, and 9 per cent potash was applied at the rate of 500 lbs. per acre and worked in each side of the row in March.

On one-twentieth of an acre the irrigated plat yielded 1928 lbs., of which only 2 lbs. were unmarketable. These yields are at the rate of 676.5 and 350 bushels on irrigated and unirrigated areas, respectively. The onions sold at Beeville for 2 cents a pound. The net profits on one-twentieth of an acre with irrigation was $33.45 and from the unirrigated plat $15.69. All of the expenses, such as cost of preparing land, irrigating, transplanting, fertilizing, harvesting, sacking, etc., are shown in tabular form. The variety used was the Red Bermuda.

It is believed that the results secured in these tests with irrigation would have been greater had the irrigation facilities been more efficient. At times the onions suffered from lack of moisture. In the variety tests 19 varieties were compared. The Bermuda onion again proved superior in point of earliness and yield.

DISEASES OF MELONS AND CUCUMBERS.

In a West Virginia Station Bulletin brief notes are given on the leaf spot (Cercospora citrullina), downy mildew (Plasmopara cubensis), leaf mold or blight (Alternaria brassicae nigrescens), and damping off, due to Fusarium sp.

The results of the author's investigations on the anthracnose (Colletotrichum lagenarium) are given at some length. The author describes cultures of the fungus, the germination of the spores, development of the mycelium, etc., and gives results of inoculation experiments that were made to determine whether the fungus causing the disease known as anthracnose of the watermelon could produce anthracnose in other plants. Inoculations were made from pure cultures and from watermelon fruits into a number of other plants, and the anthracnose was successfully produced on muskmelons, cucumbers, gourds and watermelons. Failures are reported in all the attempts to inoculate beans, and doubtful results were obtained with inoculations of squashes and a few other plants.

Experiments were carried on for the prevention and control of anthracnose, in which plats were sprayed with soda Bordeaux, Bordeaux mixture, and ammonical copper carbonate. The results of the applications showed considerable difference between the sprayed and unsprayed plats, and, considering the improved quality of the melons and the reduced amount of anthracnose, it appears that spraying with Bordeaux mixture was quite successful in combating the disease. The use of the ammoniacal copper carbonate solution was less successful.

CONTROL OF ASPARAGUS RUST

Results have shown that by careful attention to cultural methods and the relation of moisture to the development of the fungus the disease can be controlled to a considerable extent. Continued studies have shown that the rust can be almost completely controlled in California through careful attention to cultural methods and the use of treatments which are described at considerable length.

In 1904 an extended series of experiments were inaugurated by the State University to test the efficiency of sulphur, both as a liquid spray and as dry powder, for the control of the fungus causing the rust. Sulphur, either in dry or liquid forms, acting largely by its gaseous fumes, is a satisfactory rust preventive when properly applied. This treatment can be applied economically and practically in any of the districts covered by the investigations.

The use of contact sprays failed to give good results, but of those used resin Bordeaux was best and soap Bordeaux nearly as good. In general no spraying method should be resorted to until rust control by cultural means has been carried as far as possible, and it is probable that without reasonable attention to cultural methods the best of spraying will prove a failure.

The method of the application of dry sulphur, time of treatment, amount of sulphur required, and the relative efficiency of different kinds of sulphur are discussed at length in a University bulletin; the cost of material and application being estimated at from $5 to $6 per acre for two applications during the season. Where the sulphur spray is used it is said to have some advantage and be more efficient, a single application being considered the most effective single treatment for the rust.

VEGETABLES FIRST.

It is said that there is no other interest than those of fruit growing and truck growing for which railroad companies could be induced to subordinate their passenger traffic. Fruits and vegetables are given right of way, and even passenger trains are side-tracked to permit trains laded with them to pass.

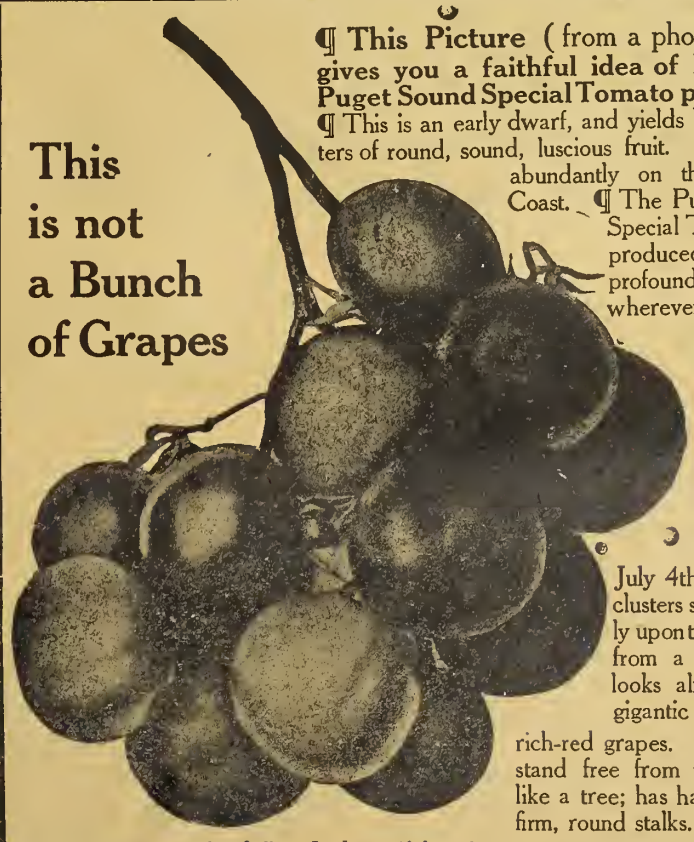
This is not a Bunch of Grapes



¶ This Picture (from a photograph) gives you a faithful idea of how the Puget Sound Special Tomato produces. ¶ This is an early dwarf, and yields large clusters of round, sound, luscious fruit. It thrives abundantly on the Pacific Coast. ¶ The Puget Sound Special Tomato has produced a most profound impression wherever it has been used. In the Puget Sound Country it has been yielding full ripe fruit as early as July 4th. The fruit clusters so prolifically upon the vine that from a distance it looks almost like a gigantic bunch of rich-red grapes. It tends to stand free from the ground like a tree; has hard, heavy, firm, round stalks. The fruit stands shipment splendidly. Its beautiful color and freedom from blemish makes it a favorite among housewives and restaurant keepers. ¶ Abundant yield renders it an extremely profitable tomato for the truck gardener. It sells in preference to any other tomato on the market. This tomato was perfected solely in our trial grounds at Brighton Beach and can be obtained only from us. Northern grown and hardy. Order now. This Puget Sound Special tomato will please you more than any vegetable in your garden.
Sold only in sealed packages. ¶ Price (prepaid) packet 10c, ounce 60c, lb. $6.

C. H. SESSIONS, ASSOCIATE EDITOR

BUT THERE'S ROOM FOR OTHERS.

Jersey cows are pre-eminently butter cows. This is their special merit. For this special work they are approached by no other breed save alone their counterpart the Guernseys. Other breeds of cows have merit, and have value, equal it may be, fully equal to the Jerseys, but their great value is in a line deviating from that in which their rivals excel. There is no room among cows, no cause, for a war of breeds. The merits of each breed—and they all have merit—is in the taste or fancy of the owner, or in the purpose for which they are wanted. That merit in either of the breeds is clearly defined, and no one seeking cows need go amiss for what is best in his case. In every case it is first a decision of what is to be done, and after that is decided it then becomes an art of getting the breed of animals suited to that kind of work.

We get tired, on the part of breeders and of their special breed journals, of the continuing belittling of other breeds so frequently heard and published. Better efforts in holding up and pushing to notice the merits of the breed represented than in an effort to belittle that of their rivals. While there is no breed that meets a more important field of usefulness than the Jerseys, yet there is room for others and all are wanted.—Jersey Bulletin.

THE KEEPING OF SWINE AS AN ADJUNCT TO DAIRYING.

As pork products are commanding better prices than for several years, it will be for the interest of farmers keeping cows and especially where there is a supply of milk the year around, to pay attention to keeping of swine.

As now, more than formerly, lightweight hogs are more in request than heavy ones, it becomes possible with good management to raise and fatten two broods of pigs in one yar, as at six months old they will be ready for market and at good prices.

This will allow a good number of pigs being grown and fattened with a moderate sized dairy.

To make the business most profitable brood sows should be kept on the farm and the pigs raised for use, thus saving the cost of buying, besides having such breeds as are best for the purpose.

Where a sow proves to be a good mother, gentle and easily managed, it will be best to keep her raising pigs as long as she will do well, as this is preferable to frequent changes.

She will bring two litters in a year and when not nursing her pigs can be quite cheaply kept.

Where pigs are raised in cool, wet weather, such as we have a little later it will be necessary to provide warm dry, comfortable quarters, and where these are furnished there should be no trouble with them, at least this has been our experience.

The pigs are weaned at five weeks old, and then fed on skim milk and buttermilk from the dairy, commencing very soon with a small grain feed, increasing it as the pigs grow older. The idea is to keep them healthy and hearty, growing and fattening at the same time. Middlings are the best until within a month or six weeks before disposing of them, when corn meal should be fed with the milk to give them a good finish.

At six months old the pigs should weigh from 150 to 200 pounds live weight, and bring a remunerative price.

The grain feed will cost nearly $3.00 each, and the balance may be credited to the milk from the diary.

In our own practice, the breeding sows and fattening pigs have always been kept in pens and small yards, but during ten years or more, not one has been lost by disease, which goes to show that they are healthy and hearty. Where it can be done, it would doubtless be better, at least to have the brood sow run out on the ground during warm weather.

The amount of manure that can be made from the progeny of even one sow, with plenty of material for the purpose, is an item worthy of the most careful attention, and will go far toward paying for the care bestowed on this kind of stock.

In the middle West the raising and fattening of swine is made a specialty of, and on a large scale, regardless of the keeping of dairies, but here it can only be made profitable when pursued in connection with the keeping of cows. It is an adjunct to dairying, one of the leading industries of California farmers, and as such adds materially to the receipts at the end

A Typical Milker.

FACTS ABOUT ALFALFA.

Alfalfa seed weighs sixty pounds to the bushel. For a hay crop, sow twenty to thirty pounds of seed per acre. For a crop of seed, sow fourteen to eighteen pounds per acre. Sow clean seed.

Sow alone, without any nurse crop. The latter is often just as harmful as the weeds.

Screen alfalfa seed before sowing to separate the dodder and other weed seed. Dodder is the worst enemy of alfalfa.

Sow alfalfa in the spring, as soon as the ground is warm—from the middle of May. Sow in drills or broadcast. Do not cover the seed too deep.

What You Gain In a few words, you gain this by using a Tubular: (1). One-quarter to one-half more cream, because Tubulars skim by centrifugal force, which is thousands of times stronger than the force of gravity that makes cream rise in pans. (2). One-half to twice as much for butter, because Tubulars remove dirt and bacteria, thus making gilt-edge butter possible. (3). Half the work saved, because you finish skimming five minutes after milking, feed warm skimmed milk at barn, and have only the can of cream to care for. Write today for catalog W-260. It tells all plainly.

of the year, as well as to the continual enriching of the soil.

In closing I will give an instance showing more particularly the profit that can be made out of this business when rightly conducted.

A farmer with a dairy of 20 cows—full blood Jerseys—last year, after supplying the milk required for several calves, fattened and sold 30 pigs. Aside from the milk from the dairy, these pigs consumed grain at a cost of $55. The first cost of the pigs was $57.

They were sold at five and six months old and averaged a little over $100 each, netting him $210, after paying for the meal and first cost of pigs.

This would be an average of a little over $10 per cow, which was indeed a most wonderful result. This farmer calculates that he gets from 20 to 32 cents per hundred pounds for the skimmed milk when fed to pigs in connection with the grain. Is this not a result worth considering and working for? So it would seem.—E. B. Tole.

FACTS ABOUT GOATS.

Many people in some way have become possessed of the opinion that the goat is practically a useless animal. They do not reach conclusions upon investigation, however, and do not discriminate between the different breeds. To them a goat is a goat, and there the argument ends. Investigation proves that the Angora goats are not only classed among the most useful of the domestic animals, and have been so classed for hundreds of years, but their usefulness is manifested in a variety of ways. The fleece, called mohair, furnishes some of the finest fabrics among various manufactures, their habit of browsing enables the farmer in a wooded locality to use them to help in cleaning away the forest; their flesh is exceedingly delicate and nutritious; the milk, though not so abundant as with the milch breeds of goats, is richer than cow's milk; their tanned skins, though inferior in quality to the skins of the common goat, are used for leather; their pelts make the neatest of rugs and robes; they are excellent pets for children; a few of them in a flock of sheep are a protection from wolves and dogs; their manure is noticeably helpful to the grass which follows them after they have cleaned away the underbrush.

Their value in their own particular sphere cannot be too highly estimated. We only wonder why this industry has not developed more.

PROFITABLE FEEDING OF THE DAIRY COW.

There are two common mistakes made in feeding cows; first, not feeding liberally enough; second, feeding a ration not properly balanced. It has been found by experiments that about sixty per cent. of what a cow can eat is necessary to merely maintain her without producing any milk or gaining in weight. This being true, it is evident that it is not economy to feed only a little more than this sixty per cent. needed to keep up the cow's body.

Below are given balanced rations that will furnish the materials necessary to produce milk in about the right proportions. By the term "rations" is meant the feed for twenty-four hours. If a cow will not give a good flow of milk in the early part of the milking period, when fed a liberal amount of one of these rations, it indicates that she is not adapted by nature to be a dairy animal and she should be disposed of. The amounts given are considered about right for a cow giving from twenty to twenty-five pounds of milk per day. For heavy milkers these rations are to be increased and reduced for lighter milkers. In making up these rations, it is designed that the cow be given practically all of the roughness she will eat and then sufficient grain is added to furnish the necessary amount of digestible material.

If clover is fed, use the following proportion:

(1) Clover hay, 20 pounds; bran, 5 pounds; corn, 6 to 8 pounds.

(2) Clover hay, 20 pounds; oats, 4 to 5 pounds; corn, 6 to 8 pounds.

(3) Clover hay, 20 pounds; corn and cob meal, 8 to 10 pounds; gluten or cottonseed meal, 2 pounds.

If alfalfa is fed the ration should be:

(4) Alfalfa or cowpea hay, 10 to 20 pounds; corn, 9 to 12 pounds.

(5) Alfalfa or cowpea hay, 10 pounds; corn stover, 10 pounds; corn, 8 to 10 pounds, and bran, 2 pounds.—C. H. Eckles, Missouri Agricultural College.

TREATMENT OF HOG CHOLERA.

After years of experience with the different hog cholera remedies and cures swine breeders have found that the most satisfactory method of preventing loss from hog cholera and swine plague is to use all possible precautions against the introduction of the germs of these diseases into the hog lot. When infectious germs are as widely distributed as these, preventive precautions will not always protect the herd from them. We must then use other methods of treatment, however unsatisfactory they may be. The medical treatment of hog cholera and swine plague has always been unsatisfactory. The only good results from the so-called cures and remedies seem to have come from the recommendation of cleanliness about the hog houses and yards and the dieting of both the well and sick animals as a part of the treatment. A few years ago the country was flooded with these preparations, but the demand for them has greatly decreased, and those still on the market owe their existence largely to the skill with which they had been advertised. The different antitoxins and methods of vaccination are what swine breeders are interested in at the present time, as they seem to offer more as preventive and curative agents than any other line of treatment. The yards, feeding floors, troughs and hog houses, must be kept clean, all litter must be removed daily, and the frequent spraying of the hogs, feeding floors and sleeping quarters with a water solution (two per cent. or more) of some tar disinfectant is a necessary part of the care. Both the sick and well hogs should be fed a light diet of sloppy food (shorts, bran and the like). Water or slops must not be left in the trough for the hogs to wallow in. Copper sulphate, four or five ounces to the barrel, may lessen the chances for infection. As soon as a hog comes down with the disease it should be removed to the pens set off for the sick animals. These pens

Stock Food
is sold on the honest plan of satisfaction or no cost. This is a straightforward plain talk and means just what it says.

Use **Security Stock Food** (glutenized) for growing animals; for fattening animals; for work horses; for milch cows. The Food won't cost you a cent if you can't see that **Security Stock Food** has saved feed, made quicker growth; kept your animals in better condition, given more milk, and made you more money. Write us if not satisfied and we will refund price in full. You are the sole judge. No questions asked.

For five years this guarantee has been on every package sold. It also covers Security Poultry Food, Lice Killer, Gall Cure, Colic Cure, Worm Powder, Calf Food, Heave Remedy, Healer and Rheumatic Liniment. Security preparations are sold by dealers in almost every town in the United States, who will recommend them highly and "back up" our guarantee.

SECURITY IS THE ONLY GLUTENIZED STOCK FOOD.
SECURITY STOCK FOOD CO.
MINNEAPOLIS, MINN.

should not communicate in any way with pens where the well hogs are kept. The dead hogs should be burned. This is not a difficult task if the body is placed on top of a pile of wood that will burn quickly and make a hot fire. The length of time the hog house and their surroundings will remain infected will depend on the care taken in cleaning them.

FEED THE DAIRY COW.

Dairymen often complain that their cows do not yield the milk they should. They do not know the cause, but lay the blame upon the cow when in fact, the fault is in underfeeding. The following from the Farmers' Tribune will be of value to the dairymen at this time when the colder weather is cutting down the milk supply.

"A cow at active work in the dairy requires from 22 to 25 pounds of dry matter for each 1,000 pounds of live weight. This dry matter should contain about two pounds of digestible protein, seven pounds of digestible carbohydrates and seven-tenths of a pound of digestible fat. Some cows will consume a larger amount than this with profit while others should be fed less. In other words the feed should be regulated by the amount of milk produced, or rather the cow should be fed all she will eat, provided she makes profitable returns therefor."

Readers of the Cultivator will remember that our advice has always been to feed liberal, well balanced rations. We can no more expect the cow to milk generously on a stinted feed than we can expect a man to work on half a meal.

It is a poor policy to underfeed any animal. Some years ago the New York experiment station found a farmer who, according to prices of feed stuffs in New York, was feeding his cows a ration that cost him $28.50 per head per year. His cows were under-fed and yielded only $25 worth of milk per head per year. That is, each cow was actually kept at an annual loss of $3.50. To demonstrate what might be accomplished with a herd of that kind, the station purchased the cows from this dairyman and fed them a liberal ration the following year. The cost of the feed, considering the price per ton the same as during the previous years, amounted to $34 per head, but the cows yielded an average of $40 worth of milk per head, giving a net profit of $6 per cow instead of a loss of $3.50 during the previous year when they were underfed.

This is simply one instance showing the value of liberal feeding. We mention it with the hope that some of our readers may get busy and study the cost of keeping their cows and returns secured therefrom.

WATER FOR HOGS ON ALFALFA.

An amateur in hog raising writes E. J. Wickson to inquire if it is necessary to provide water in an alfalfa patch where hogs run. The idea being to know if alfalfa alone will produce sufficient moisture for the hogs. This same question was recently asked of the Cultivator. Prof. Wickerson gives the following answer:

"We never have seen nor heard that hogs could be kept for any length of time on alfalfa pasturage without drinking water. Where it may be difficult or expensive to provide water in a field it is customary to let the hogs go to their own drink at intervals—say once a day. On all general principles good drinking water should be provided."

PREVENTING CONTAMINATION DURING MILKING.

Milk contamination takes place largely during the process of milking, especially when the cows are kept in the barn. It was, therefore, thought best to start with investigations along this first and most troublesome source of infection, namely, milking.

The plan of the experiment was to test a number of advocated methods of lessening milk contamination. To do this, four cows were selected from the university dairy herd, all uniform in breed, weight and time of lactation, so as to avoid, as much as possible, variation among individual animals. They were treated before each milking in the following manner:

The udder of cow No. 1, Diana, was sponged with water. The udder of cow No. 2, Annie, was sponged with a 5 per cent. solution of carbolic acid. The udder of cow No. 3, Hattie, was rubbed with vaseline. The udder of cow No. 4, Cora, was not treated, but the dust merely brushed off with the milker's hand as in the usual way.

The animals were tested both in the barn and out of doors. Exposures were also taken to compare cemented and wood floors with and without bedding. Exposures were also made in the barn, both when the cows were present and when they were absent, to determine the condition of the air. In all, some 200 plates were exposed, developed and examined for bacteria with the microscope.

The following is a condensed table made by averaging 100 exposures under the methods named:

	Colonies.
Dishes exposed under udders treated with 5 per cent. carbolic acid	344
Dishes exposed under udders treated with vaseline	346
Dishes exposed under udders treated with water	483
Dishes exposed under udders not treated	20,500

Conclusions.

It is safe to conclude from the foregoing experiment that some means of preventing milk contamination during milking should be employed.

The work required to sponge an animal's flank and udder is but a trifle, and great improvement can be made on the milk and its products.

The acid solution costs two cents per gallon, which is enough to treat ten cows. The only objection to this method are the disagreeable odor and the bother of mixing.

The vaseline costs about the same as the carbolic acid and serves as a good preventive for chapped or sore teats. It is also to be recommended for cows with sore teats which have to be milked by the stripping method. This treatment will not answer when the cows have dirty udders.

The water treatment is to be recommended for general use above the other three, as it is cheaper and does the work practically as well. This method can be used on any farm with little or no inconvenience, and the results obtained would more than compensate for the extra time required.

Cement floors are not only easier to keep clean, but are also less favorable to the growth and development of bacteria.

While it is necessary to use bedding in winter, in summer when cows are kept in the barn only during milking and feeding time it may be dispensed with to the betterment of the milk.

Milking out of doors in clean yards or pasture gives better results than in clean barns, even under the best of conditions. — Nebraska Experiment Station.

METHODS OF FEEDING SKIM-MILK CALVES.

The department of agriculture has recently prepared a farmers' bulletin in which is given some data relating to the feeding of skim-milk calves. The method of proceedure in rearing the skim-milk calf at the Kansas station is given, which is as follows:

The calf was allowed to run with its mother the first four or five days of its life. It was then removed and left twenty-four hours without food, when it became hungry and was easily taught to drink. For a week thereafter it was fed whole milk at the rate of four pounds in the morning, two pounds at noon, and four pounds at night. The second week about the same amount of milk was given in two feeds, morning and night. Within two or three weeks after removal from the cow, skim milk was gradually substituted for whole milk at the rate of half a pint per feed until the entire amount was skim milk. About a month after the calf was taken from the cow it was receiving twelve to fourteen pounds of skim milk; at two months, eighteen pounds, and finally reached twenty-two to twenty-four pounds per day.

The grain added to the ration was fed dry in boxes. The calves began to eat grain when ten days to two weeks old. At first a handful was put in the calf's mouth as soon as it had finished drinking its milk, and it soon learned to eat with a relish from the feed boxes. The kaffir corn meal or other grain was never mixed with the milk. The calves were fed what grain they would eat up clean.

When the calves were ten days to two weeks old they began to nibble hay and were thereafter fed all that they would eat. The hay was given fresh twice daily. Some hay from mixed grasses is considered best, with bright prairie grass a close second. Clover and alfalfa may be gradually added to the ration after the calves are several weeks old. Alfalfa alone was found to be too loosening for young calves. Changes from dry hay to pasture must be made very gradually or the calves are almost sure to have scours. This is done by turning them into pasture for only a short time the first day and gradually increasing the period, or by mixing increased amounts of green feed with their hay until they are getting about all they will eat.

The most convenient way of feeding the calves has been by putting them in stanchions. Here they were kept for a half hour after feeding until their mouths dried and they had lost their desire to suck each other's ears. Fresh water was kept within reach of the calves all the time, and it was surprising to find how many times a day the calves took a sip.

Calves thus treated made an average gain of 1.58 pounds daily up to five months of age, results which were considered satisfactory. The cost of the gain in one test was at the rate of $2.26 per hundred pounds for skim-milk, and $4.41 for calves running with their dams. When put in the feed lots the skim-milk calves made better gains than either of the other two lots.

Attention is called to the danger of calves scouring when fed on skim milk, the various causes of this difficulty being over-feeding, use of sour milk, feeding cold milk, feeding grain with the milk, using dirty milk pails and irregularity in feeding.

In severe cases of scours the addition of one or two eggs with the dried food has been found very effective. Another remedy that has been found successful is to give from one to two ounces of castor oil in the morning and follow in about twelve hours with fifteen to twenty drops of laudanum and a teaspoonful of dried blood. If the case is a persistent one, one or two raw eggs may be added.

HEN HOUSES.

There are so many people going into the poultry business in So. California that a little study of the subject of hen houses may be helpful. I have just received the following letter from one of our subscribers, and I think a discussion of his plans may help others.

I have within the past two months been starting and arranging a "chicken ranch." Have new location and everything is new, including my experience in the business. I want your advice as to my way of constructing hen houses. I have put up for the matured stock houses 5x10 feet, cone roof, all covered with shakes. These houses are open at bottom all the way round for a space of 24 inches from the ground. This space is enclosed with 24 inch chicken wire. The roosts are placed about 12 inches above the lower edge of the enclosed part. There is no floor to the houses, thus the fowls roost on perches three feet from the ground, and there is a free circulation of air underneath them. In these houses I keep Leghorns. Do you think such a house adapted to the fowls' needs. I have had considerable criticism that they were too open, but as the house is pretty closely built I have thought that no real draft of air would reach the fowls, and as it is arranged to open up one entire side, cleaning can be done easily and thoroughly. I have other storm and wind breaks provided and for growing chicks have close houses with floor.

Now before answering him, or dissecting his houses, let us consider why in this climate of sunny California, this lovely climate, why do the hens need any shelter? Why cannot they sleep out, roost in the trees, and so save the expense of building houses and cleaning them? Because in this part of California a cold breeze always springs up at night, blowing in the opposite direction to the day breeze. The hen goes to sleep at sundown, facing the day breeze, and when the night breeze comes up she either has to wake up and turn round (sometimes so sleepy that she falls off her roosting place), or she is chilled by the wind blowing under her feathers for nearly eight hours. Then again, in trees there is but little shelter from the rain and fog and when we do have rain it is usually heavier at night than at any other time. I know three different poultry breeders who tried the tree roosting plan. It did fairly well in the early summer, but as the nights lengthened, roup commenced. Two of these parties went out of the chicken business, declaring there is no money in it, and the third party made small but comfortable coops. These three had their hens infested with lice, some of the fowls roosted so high in the trees they could not be caught to dust them or dip them for lice, others roosting lower were caught by wildcats or night prowlers, and one lady lost all her white fowls by two-legged thieves riding on horseback under the trees. They saw the white hens and reaching up took sixty of her choicest pullets one dark night.

* * *

Houses of some kind are a necessity but how to build them is the conundrum! It is almost as difficult to give advice about building a house for hens as to tell a man what kind of a house to build for himself, so difficult that I refrain from doing it as a rule, but I am willing to criticise in a very friendly way the house our subscriber describes, and I will also tell of some of the houses that I have used for my hens, especially some that have proved good.

The first and greatest requisite in any hen house is proper ventilation without any draft. Freedom from drafts is absolutely necessary, especially in this climate. We all know how human beings suffer from sitting in a draft; it is exactly the same with fowls. The poor things suffer terribly, yet patiently, when they have swelled heads, running from the eyes or nostrils, and finally roup. I quite believe roup to be a germ disease and the germ finds a place to germinate in a fowl that night after night is forced to sleep in a draughty house in So. California, or anywhere else. It is so easy to be careless in this matter. One year early in the fall an expert poultry breeder called to see me, a good many years ago, and with the quick eye of experience he remarked that some of my cockerels had slight colds, and saying, "There must be a draft in your hen coop." He went down on his knees and discovered where the boards had dried out and a crack had come. I too went down on my knees, found every knot hole or crack and battened them up and in a few days had no more colds among the cockerels. No drafts, but perfect ventilation is what we need in this country.

I have for many years advocated and used the "Mushroom" houses, which are what our subscriber rescribes; a small house standing up from the ground so that it has perfect ventilation without draft. A house of this kind never has a bad odor of a morning for the air passes over the droppings and the effluvia is blown away. Twenty-four inches of ventilation is in my opinion, more than necessary and necessitates making the perches or roosts too high, unless the fowls are Leghorns.

A heavy American breed of fowl would risk bruising its feet and getting "bumble foot." One only drawback to "Mushroom" houses is that if the hens are confined in them after they jump down from the roost they are apt to take cold from being in a draft. One has to be an early riser to be up when the hens come down, or else leave a trap door open so they can get out, and risk night marauders.

The "Mushroom" houses can be made of shakes, flooring, canvas, burlap or common domestic. They all answer well, but of course, the wooden houses last much longer than any others.

* * *

The house that I prefer above all others for this climate, is one built of wood (shakes or tongue and grooved), perfectly tight on three sides and roof and on the fourth side only closed with chicken wire for summer and a curtain of burlap to be let down over the wire in rainy or stormy weather. This is an admirable house, also, for a hen and brood of chickens, and I never have a sick chick or any colds in my family in these houses.

The thing of all others to be avoided is a draft. Never ventilate by an opening above the fowls or in the roof, the foul air is heavy and sold and it falls, the pure air is lighter and warmer, and by having the ventilator high it makes an upward draft, carrying off the warmth, and chilling the fowls.

MIDLAND
IF YOU WANT EGGS YOU WILL FEED NO OTHER
Used by all the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders
The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the GOLD MEDAL at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?
St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.

And Now Comes New Reward for Merit:
Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

PRACTICAL INCUBATORS positively the best. Hatches more and stronger chicks. 10 YEARS' GUARANTEE

Cal. free. PRACTICAL INC. CO., 720 S. 11th St. San Jose, Cal.

The comfort of the fowls is largely to be considered in building their house. The three essentials of egg production are comfort, exercise and proper food. We want to make our fowls so comfortable, with such sanitary measures that they cannot help giving us a good return of eggs. Houses need not be expensive and ornamental unless one has ample means to justify the outlay, but they must be comfortable. In laying out a place as our subscriber writes, it looks well to have the houses all the same size, the nests all alike, scratching sheds also, and even the troughs or hoppers and the drinking vessels all uniformly similar. This gives an air of prosperity and thriftiness to the whole place, and does not cost much more. Neatness and order in the poultry yards will make more sales than anything except fine birds, and even the beauty of fine birds is enhanced by good surroundings.

SILVER PENCILED WYANDOTTES.

"It is surprising to notice," says the Country Gentlemen, "the strides forward being made in the Standard breed of Silver Penciled Wyandottes. and the non-standard breed of Silver Penciled Plymouth Rocks. Both of these have the markings of the Dark Brahmas, one of the best egg-producing breeds that ever were, and the Wyandotte blood coming from the original or Silver Penciled Wyandottes. The Silver-Penciled Wyandottes have won the egg-laying contest in Australia for two years. The Dark Brahmas are wonderful egg-producers. The union of these two created both the Silver-Penciled Wyandottes and the Silver-Penciled Plymouth Rocks. The careful cultivation by best breeders of poultry has gained best color and markings upon these two varieties than have ever been successfully bred in the Dark Brahmas. The Silver-Penciled Plymouth Rocks are large, beautiful-colored birds, and are great egg-producers."

AVOID CHANGES.

Every poultry breeder knows, or ought to know, that sudden changes are undesirable for his stock.. Yet very many, influenced by mistaken kindness, which more honors their hearts than their heads, will, upon the advent of cold nights, suddenly and without previous preparation, remove their feathered flocks from surroundings where they have enjoyed an abundance of pure air and ample room, to the confinement of tight houses where both space and air are limited. The result almost inevitably is that the fowls droop, sicken, become unprofitable and unsatisfactory, and not a few die. The sudden change upsets their digestion and impairs the oxidation of the blood. Diarrheal and lung troubles follow; colds, swelled heads, roup and the like are contracted; growth ceases or progresses slowly, and egg-production diminishes or stops; profit turns into loss, pleasure into disgust.—Country Gentleman.

Many people have been quite successful in the past few years in growing White Holland turkeys. The indispensable requisite for success with White or any other variety of turkeys is to have strong, vigorous, not less than two-year-old females, mated with fine toms of foreign blood. Inbreeding must be absolutely done away with to be successful in growing turkeys. Diseases, so destructive in the past, can be driven out through the selection of strong females and absolutely non-related males.

EDITOR'S QUESTION BOX.

Mushroom House.—(F. E. B., San Jose). I am told that there is a poultry house made of canvas with a shingle roof in use at Rosecrans, or some such named place, somewhere between Los Angeles and the Coast. It is said to be tipped up during the day so that the ground can be cleaned. Can you tell me if such an house is used and if it is successful? If same is successful there could we use it here? I did not learn where the hens have nests, nor do I know whether growing stock or laying hens are housed therein.

P. S. I very much appreciate your article in your letter of Sept. 20th. It was helpful.

Answer.—See article in this paper on hen houses. These houses are used in many places and are very satisfactory. The hens have nests outside and away from the houses.

* * *

Who Has These.—(J. A. W., Hanford). Kindly inform me who has the thoroughbred Embedden or Bremen geese for sale.

Answer.—I do not know of any. Shall be glad if any of our readers can answer this.

* * *

Lice.—(Mr. E. M. Campbell). When we moved on to this place a few months ago, we found there were mites on the roosts. We used both whitewash and crude oil and got them clean, and yet the chickens pick themselves all the time and on close examination I find they have lice. Can you tell me how to get rid of them?

Answer.—Make the following: Dissolve a bar of laundry soap in a gallon of coal oil and one pint of crude carbolic acid, churn these together until cold. Take one quart of this mixture and put into ten quarts of warm water. Wash the hens thoroughly in this, soaking every feather to the hen's skin. Pull out all feathers that have nits (lice eggs) on them. Do this on a warm, sunny morning. Examine in a week and if there are any lice repeat; or you might after once dipping your hens powder them thoroughly once a week or oftener with Lambert's death to lice. Paint the perches once a week with Lee's lice killer, but do not put it in the nests. It will flavor and spoil the eggs.

* * *

Sick Turkeys.—(Mrs. J. A. Corning).—I have read so many helpful things in the Cultivator that I thought I would ask for some help for my sick turkeys.

About two or three weeks ago one of my largest turkeys seemed kind of droopy and in a day or so it could scarcely walk. I examined it, but could not see anything wrong with its feet or legs, but in another day or two I noticed a slight swelling in the joints of its legs. I rubbed them with camphorated oil but it rapidly grew worse until it could not walk at all. Its appetite remained fairly good. I gave it sulphur in mash, but about two weeks after it took sick it died. Now there is another going the same way, only the trouble seems to be in its feet instead of the leg joints. Will you please tell me through the Cultivator what is the trouble, and what I can do for them. I feed turkeys a mash in the evening composed of Coulson's food and bran. Wheat in the morning.

Answer.—Your turkeys have rheumatism. I wish you had mentioned either their age or weight, so that I could prescribe more easily for them. If they weigh eight pounds or over, stop giving a mash; feed whole grain and add corn or kaffir corn. Also either good meat scraps or curd of milk, and give each turkey a liver pill, any that you use in your family.

Bathe the feet or legs with the following: One cup of turpentine, one cup of vinegar and as much saltpetre as it will take up, about a tablespoonful. This is a great relief to rheumatism in the human family also.

Chopped onions and dry bread crumbs for young turkeys, but no mashes. The livers of your turkeys are not in good working order and rheumatism has resulted.

* * *

Wyandottes.—(W. H. S.), Santa Barbara, Cal.). Will you kindly tell me what strain of White Wyandottes are considered the best layers? And where can I obtain them?

Answer.—There are several strains of fine Wyandottes advertised in the Cultivator. Mrs. C. D. Hubbard (see her ad.), has for years selected eggs from her best layers and has now a flock of remarkable layers, developed by careful breeding and close culling.

* * *

Imported Pullet Dead.—(A Subscriber, Oxnard, Cal.). Please refer these poultry questions to your efficient editor, Mrs. Basley: One of my Orpington pullets, shipped out from the East three weeks ago, died without apparent cause. Upon examination I found crop empty, gizzard full of grains, with little grit, and intestines empty; hen was quite fat and had two eggs developed to the size of dove eggs. Comb was pale ever since I received her. I find my fowls have too loose droppings, almost diarrhoea, I fear. I feed in hoppers two parts dry bran, one part corn meal, 1 part Swift's beef scraps, in addition I feed two parts wheat, one part cracked corn, 1 part oats, 1 part crushed barley in litters. They have the very best of accommodations, with pure water and their grit consists of river gravel, laying scattered in their pans. Your instructions of charcoal, shells, exercise, ventilation and cleanliness carried out; positively no lice. Please put me on guard as to trouble that I may not lose more. (2) Is river gravel all right for grit? I wish to add, I fed mangled wurtzel beets for green food to the above hen.

Answer.—Your imported Orpington pullet was evidently (judging by her comb), not in vigorous health when you received her. It has been found that a change of climate will sometimes develop any latent disease in a fowl. Liver complaint, I think, was probably the cause. Did you notice particularly the liver; was it of the proper color, or too light colored. Was it tender or brittle, or spotted?

The gizzard having but little grit in it indicates indigestion; also the looseness in the bowels of your fowls. I would suggest your not mixing the beef scraps in the bran and corn meal, but putting it in a separate hopper as you do the charcoal, etc. Also carefully examine the beef scrap, keep it dry and never feed any mouldy grain or food.

River gravel is usually not sharp enough for good grit; it has been worn smooth by the action of the water. You can test your fowls by pounding up some broken crockery to about the size of a split pea. If they eat it with avidity you may decide that the river sand is not sharp enough. Another reason for the need of supplying other grit is that if your fowls have been for any length of time on the ground they have probably picked up all the sharp bits of stone and those that are left are not sharp enough to grind their food. A bit of grit should have three sharp sides to it. This is quite an important matter.

POULTRY SUGGESTIONS.

Late hatches should have dry,,warm houses in the cool weather. They are very susceptible to cold and need a dry, sheltered loafing place on cold, wet days, as well as a warm place to sleep at night. Many a siege of roup can be traced to a bunch of poor, neglected, late hatched chicks. When debilitated by exposure to cold and wet they take cold easily, and colds are very apt to develop into roup, the disease that has spoiled the shining prospects for many a poultry raiser. Hens will run with fall chicks until half grown. They seem to know their overgrown babies need plenty of warmth. The old hen method is the best if we want a few Christmas fries.

When other duties on the farm are crowding and something must be slighted it is apt to be the chickens. Whether we keep common mixed chickens or high priced pure breeds we ought to think enough of them to do the best we can by them in the way of comfortable houses for winter. Our houses are built as close to the ground as possible with good drainage. Cold air circulating under the floor is not good, and the higher a house is from the ground the colder it is.—Fannie M. Wood, in Successful Farming.

DON'T FRIGHTEN HENS.

If you expect your hens to lay regularly you must treat them kindly Never scare them nor chase them. When handling them exercise care to be gentle. Do not hurry in caring for them either in feeding or dusting.

Prussian Lice Killer

Easy, quick and certain riddance of vermin on poultry and animals.

Can't Get Along Without It.

"I am using the Prussian Lice Killer and could not possibly get along without it. Keeps the poultry house and chickens free from lice and mites. I have used other makes, but Prussian is the best." Fred Fiesel, Wilmington, Cal.

Prices: Qts. 35c, ½ Cal. 50c, 1 Gal. 90c, 5 Gals. $4.00.

Prussian Lice Powder

The dust method. Sure death to lice, no injury to birds or animals.

"I used a 25c package of the Prussian Lice Powder on 16 head of lousy cattle, and the day after could not find a louse. I consider it the best thing I ever saw." H. V. Spafford, Kelso, N.D.

In 25c and 50c Packages.

Prussian Poultry Food

Guaranteed to produce healthy fowls, more rapid growth, make better layers and to ward off and cure Roup, Gapes, Cholera, etc.

"We have used Prussian Poultry Food for more than two years with great success We find that it is the proper food for young chicks and just the thing to keep up laying hens." Arnold Jungman, Poultry Yds, Gladstone, Minn.

In 25c and 50c Pkgs. 25 lb. Pail, $3.50.

General Agricultural Notes

CAMPBELL SYSTEM OF DRY FARMING.

Mr. Campbell's principles, as he explains them, are:

First—Catch the rainfall and store it where the roots of the plant can reach it.

Second—Keep the soil always fine and loose.

Third—Have a firm, solid foundation under the soil—a bottom to hold the water.

The careful regular application of these principles in farming will produce at least three times the results of ordinary farming, and often four and five times the results.

Store the rainfall in the soils, by keeping the surface of the ground always loose, which stops evaporation. It is impossible for moisture to rise to the surface through loose soil, and that leaves the ground in the best condition to receive the next rainfall. Thus you can make fourteen inches of rain go as far as twenty-five or thirty inches in raising all kinds of crops, plants or trees. We do not lose any of the rains—we have the full benefit of it. We keep it stored where the roots of the plants can reach it when they need it.

Stir the soil with a revolving disk and then going over it again and filling up the furrows. We call this "double-disking." It pulverizes the soil and levels it off. We keep going over it again and again. After every rain we stir up the soil, either with a disk or an "Acme" harrow. Finally we plow seven inches deep in the ordinary way and follow the plow with a subsurface packer—a machine which makes a compact, solid bottom, four inches from the surface, under the loose soil. Then we go over it again with the Acme harrow so as to keep the top soil loose and pulverized. After working the soil for a year in this way, by what we call "summer tilling," we put in our wheat, either in the fall or in the spring, as is usual. The first year we do not put in any seed. We simply keep stirring up the soil so that it will remain loose and pulverized, and after one year of this sort of cultivation three crops can be grown in succession without renewing the tilling.

PERCOLATION OF RAINS.

In a bulletin on the above subject, the author records the results of observations on the rate of percolation of water through sandy loam, loam, clay loam, heavy clay soil, and garden soil which had been subjected to prolonged drought. For the purpose of the observations the soils were packed in glass tubes 13⅜ inches in diameter and water was poured on them from time to time in amounts equivalent to 0.1 to 1 inch. The slowness of percolation in case of the clay soils indicates that with such soils more than 50 per cent. of the rainfall (the proportion given by Lawes and Gilbert) would be lost by evaporation and surface drainage.

EUCALYPTUS FOR FIRE SCREENS.

A note in the Indian Forester states that in Cape Town, South Africa, six rows of eucalyptus planted six by six feet are placed around plantations, etc., and within five or six years they form a barrier which no fire can cross, since they kill out all the grass completely and at the same time prevent burning leaves, etc., from being blown across.

ALKALI SOILS.

A late bulletin gives a summary of investigations on alkali soils in Montana and elsewhere, largely from a previous bulletin of the station (E. R. S., 11, p. 223), and reports results of pot experiments with alfalfa, oats, wheat, barley, and timothy on soils containing varying amounts and combinations of alkali salts. Analyses with reference to chlorin, sodium sulphate, and sodium carbonate of 358 samples of alkali soils from different parts of the state are reported. No data are reported for the experiments, but the following summary of general results is given:

"The presence of magnesium sulphate—Epsom salt—in quantity up to 1 per cent has apparently no ill effect upon the growth of alfalfa.

"The limiting quantity of sodium sulphate—Glauber's salt—for alfalfa seems to be about seven-tenths of 1 per cent.

"With a mixture of two-thirds sodium sulphate and one-third magnesium sulphate, which represents very closely the comparison of Montana alkali, the limiting quantity appears to be about the same as with sodium sulphate alone.

"It should be said that these experiments were conducted with great care, the purpose being to eliminate every adverse condition except that imposed by the presence of the 'alkali.' Especially was it provided that a sufficient quantity of water should always be present.

"In this connection it may be stated that the presence of alkali was observed, in another series of experiments, to very materially increase the drought-resistant powers of the plants under investigation.

"The results of experiments with oats, wheat, barley, and timothy tend to show that the danger limit for alkali of the character found in Montana is above 1 per cent."

POTASH NECESSARY FOR CORN.

The soil tests with corn have now been in progress in Massachusetts for sixteen years, and during this time the land has been in corn eight years and in grass four years. Corn was grown in succession the last three years, and the past year was excellent on all plats receiving potash every year. The plat receiving muriate of potash alone continuously yielded forty-seven bushels per acre, and the one receiving dissolved boneblack in addition yielded fifty-three bushels, being a better yield than was obtained on the plat treated annually with five cords of barnyard manure per acre. The importance of a liberal supply of potash in fertilizers for corn is pointed out by these results.

POTATOES LIKE NITRATE.

Potatoes grown this year in connection with comparative test of different sources of nitrogen, on the basis of yield secured the materials ranked as follows; Barnyard manure, nitrate of soda, dried blood, and sulphate of ammonia. Based on the increase in all the crops since the beginning of the experiment, as compared with the check plats, the relative rank of the different fertilizers was: Nitrate of soda 100, barnyard manure 83.6, dried blood 66.9. and sulphate of ammonia 56.9. The growing of soy beans has so far shown but little effect on the succeeding crop.

GAYULE AND ITS ECONOMIC IMPORTANCE.

In a German bulletin a description is given of the guayule rubber plant (Parthenium argentatum), which grows wild in Mexico and which is being harvested and used commercially for the production of rubber.

The methods of extracting rubber from this plant are briefly described and the possibilties of the industry discussed. At present the dried plants bring from $30 to $40 per ton. Recently methods for manufacturing the rubber from the plant have been so improved that besides the water content of the rubber there is but from 10 to 15 per cent of foreign substance. The dried plants furnish from 8 to 12 per cent of rubber, depending upon the amount of moisture which they contain.

The plant grows very slowly and after it has once been cut off requires about ten years to again reach suitable size for cutting. These calculations give an idea of the extent of land required to make the growth of this plant profitable commercially.

Some of the advantages are that the plant will grow on very poor and dry land. It grows best in a subtropical climate, which is of advantage from the standpoint of labor, and is not injured by night frosts. The crop can be worked up at any time during the year. In districts suited to its culture it is believed that the crop can be grown profitably, especially if culture and manufacture are combined.

The San Diego County Poultry Association will hold its annual show December 13, 14, 15, 16. The premium list is at hand and contains several valuable suggestions in relation to the exhibit.

The Los Angeles office of the Cultivator has been moved to 115 North Broadway, (upstairs.)

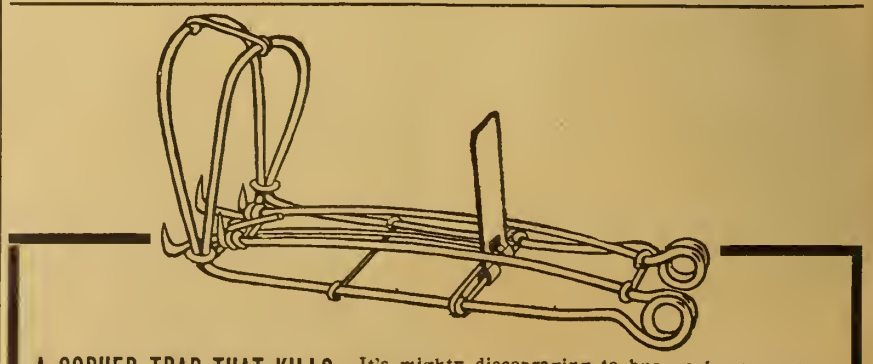
Ask Your Dealer for the E-Z Gopher Trap

If he won't supply you send 45 cents and your dealer's name and we will send you three sample traps. Best and cheapest trap on earth

J. A. W. GATES, 216-218 West Second St. Los Angeles, Cal.



A GOPHER TRAP THAT KILLS. It's mighty discouraging to buy gopher traps that permit the gopher to escape after the trap has sprung. If you have used other traps you know that gophers crawl or are thrown out of them and the gopher that has been caught and got away will never be caught again. If you would take no chances with traps, you should investigate the merits of the

IMPROVED C. V. 2-RING GOPHER TRAP.

This is a patented trap, embodying all the latest improvements. It is superior to the Single ring, as well as the Clutch and Claw Traps, or the double ring disables the gopher and holds it securely, allowing no possibility of escape.

See that you get the genuine Improved C. V. 2 Ring. Sold everywhere for 25c; or if your dealer does not have them, send us his name and 25c. for sample trap or $2.50 for a dozen, which we will forward postpaid. FALLS MFG. CO., 14 Drumm St., San Francisco.

Queries and Suggestions

PERSIMMONS AND ROSES.

Editor Cultivator: (1) Can the Japanese persimmon be successfully grafted or budded onto the common Missouri persimmon?

(2) How long will it take rose cuttings put in the ground now to take root?—J. A. D., Charter Oak.

(1) Certainly.

(2) They will root in a few weeks, but should not be moved until spring. Better still is it to leave them where they root until next summer, let them get dormant toward autumn, replant where needed and water well.

SALT BUSH HEDGE.

Editor Cultivator: I've just read with interest an article in your paper of first inst., about the hedge plant "Atriplex Breweri." Can you please tell me where I can get seed cuttings or young plants from, also about how long a time it would take to grow, say five feet high. I need a good wind break and something that will grow very quickly. Do you know of anything more suitable. Do the roots of this plant extend far out.

I enclose addressed envelope. An answer will greatly oblige. E. S. L.

Answer.—Saltbush for hedges (Atriplex Breweri) may be obtained from any dealer in ornamental stock advertising in this issue. It makes the best of hedges, especially at the seaside, and roots very lightly. It would take a little more than the first summer to make a hedge of four fect as you would need to keep side growth trimmed off to throw the energy into the heightening growth.

ORCHARD QUERIES.

Editor Cultivator: (1) What solution is best to be used to spray peach and fig trees and at what time, so as to keep different insects off which come upon them during fruit bearing time? (2) When is the best time to bud or graft orange trees, also to prune peach trees? (3) And when is the best time to plant orange trees? R. B., Reedley.

(1) If during winter, when the trees are out of leaf, use lime, sulphur and salt. If trees are in leaf use kerosene emulsion. The most common trouble with peaches is leaf curl, and figs are seldom subject to insect attacks. (2) See query department of last week. (3) Feb. 1st.

SICK CITRUS TREES.

W. W. S., Campbell—We cannot prescribe for your trees without more definite information. Leaves turning yellow might arise from a score of causes, and we can tell nothing about the leaf-eating insect unless we see it, or have a good description of same.

DIVIDING RHUBARB.

Editor Cultivator: Will the Cultivator give directions how to divide a rhubarb plant for new settings. Do you have to dig the old plant up? I have 100 Crimson Winter rhubarb plants and wish to plant more from them. H. E., Rivera.

Take them up and cut to pieces so that each piece has at least one "eye" or bud.

COMPTON INSTITUTE.

The people of Compton and vicinity will hold a Farmers' Institute at Compton Monday and Tuesday, December 18-19. Among the principal addresses will be: Walnut culture, J. B. Neff; Tuberculosis, Prof. E. W. Majors; Future of the Dairy Business, C. H. Sessions; Poultry, Mrs. A. Basley; Trees, Shrubs and Plants, Ernest Braunton; Apple Culture, Frederick Maskew; Sugar Beet Culture, J. L. Amlin; Good Roads, Col. J. J. Steadman; Proper care of Milk and Premises, Prof. Majors.

OLD INDIAN FASHIONS.

The American Indians used to grind their corn by pounding it between two stones. This work fell to the woman. An up-to-date farmer would laugh at such an old-fashioned mill—would not have such primitive methods on his farm. Indians had no way of skimming their milk except to let it stand in something until what cream would rise came to the top. The women did the skimming as well as the milking. Of course, they lost sometimes as much as half the cream by such unscientific method.

Some of the very farmers and dairymen who would laugh at an Indian mill are skimming their milk—and losing half their cream—just as the Indians did. Modern methods of skimming are as far ahead of the old method as modern mills are ahead of Indian grinding stones. The up-to-date skimming machine is the Sharples Tubular Cream Separator. It often doubles your dairy profits—skims the milk as soon as drawn from the cow—leaves fresh warm skim milk for young stock—requires that only the cream be put away. In use from Maine to California—and far ahead of pans or cans. Ask the Sharples Separator Company for their plainly written, fully illustrated catalog No.—. Address them at West Chester, Pa., or Chicago, Ill., or Toronto, Can. They have large offices at each place.

The David Bradley Manufacturing Company's corn growing contest, mention of which was made in this paper a few weeks ago resulted in a very interesting contest in which seventy-five of the leading farmers, residing in the eight counties comprising the fair district, competed. The decision of the judges was very satisfactory and all look forward to the opportunity of competing again next year. The result of the water melon seed guessing contest held at the Bradley Manufacturing Company's exhibit at the Springfield fair created considerable interest. There were 2893 guesses registered and these were decided by putting the number in a box and drawing the winner that way. The number of seeds in the melon, which was 1190, was guessed by Mrs. R. B. Hope of Roseville, Ill.

Oscar J. Weber who for the past seventeen years has been the manager at Los Angeles for the Wickson & Co. dairy supply house, has severed his connection therewith and is succeeded by T. L. Garner, who has been with the house for over a year. Mr. Weber is secretary of the Los Angeles Milk Board of Trade and also serves the Butter Board of Trade in the same capacity. During the long term that Mr. Weber has been catering to the dairymen of Southern California he has made many friends who now wish him success in the new venture he has under consideration, and he says his friends will hear from him in the course of a month.

SOME PETALUMA INCUBATORS.

A look at the Petaluma Incubator factory shows a most busy scene, machines in all stages of construction and many more finished and ready for shipment. A shipment of 400 was recently made to Australia, 200 to Sidney and 200 to Melbourne. Another shipment of 400 has been made to the Indianapolis house of the company.

IsHard, Round and Sweet= Lilly's Glory Cabbage

We perfected this variety on our own experimental grounds, and it has proven a wonderful success, pronounced without a doubt the best cabbage for this coast. It is as hard as the Danish Ball Head, and has an even more perfect roundness. It matures in mid-season, earlier than any other hard, round cabbage. In quality it proves most excellent, tender and crisp. This cabbage is destined to be the most popular variety on the coast. For market purposes it is unexcelled. It is a ready seller and it is so good that a profitable trade can be built up for it. We advise all our customers to try this cabbage. Sold only in sealed packages. Price, pkt, 10c oz., 35c; lb., $3.50.

THE YEAR.

It was beautiful in spring-time,
With its robes of emerald hue,
Its clouds of fleecy whiteness,
And its skies of softest blue.

It was lovely in the summer,
With its flower-garnished train;
When the harvest moon was shining
On the waving, ripening grain.

Now the autumn leaves are falling,
And their crimson turns to gold;
The purple fruit is garnered in:
The year is growing old.

When the softly-falling snow-flakes
Cover all the world with white;
Spring will be but a remembrance
Of blue skies and golden light.

When the winter of our spring-time
Leaves its snows on our brow,
Youth will be a fading memory
Of bright dreams, forgotten now.

When our azure skies have faded,
When our harvest moon has set,
If our purple fruit was garnered,
We'll have Heaven left us yet.
—Virginia Keating, in Farm and Home.

Faithful to the End

Mrs. James Humphrey relates this story, in the American Club Woman, of the fidelity of club friendship. It is an interesting article in support of the modern woman's club, which is being assailed today by anti-club believers as one of the causes of the demoralization of the home and kindred conditions which prevail in society:

"The club was not many years old when it received a valuable accession to its membership in Mrs. George Baring. That she was well born and bred, superior in mental qualities, refined in manners and of very attractive personality was apparent at once. It was also manifest from the style of living adopted by her husband and herself that they were not lacking in wealth. They took rooms at the highest priced hotel, paid liberally for every service, and required and enjoyed the best of everything. They proved to be both sociable and hospitable, and the best people of "M" received them as friends.

Mr. Baring signed himself "Capitalist" and entered into some speculative schemes for which he seemed to have the ready money, though it was given out that most of his fortune was invested elsewhere, but would in time be disengaged and brought West.

Mrs. Baring at once took that place in the club which she never lost. Among the first in diligence and thoughtfulness, as well as energy and enthusiasm, each year more and more endeared her to the little group to whom it was given to stand by her in the dark days of misfortune which came to her.

For after several years of seeming prosperity and happiness a sudden cloud overspread her sky. Mr. Baring's absences, always frequent, began to be prolonged, and as they were, without doubt, a congenial couple, Mrs. Baring's bright spirits were in consequence somewhat dimmed. But she put a brave face on the matter. "It was business, perplexing business," she said, "that kept him away. and she should be only too glad when circumstances so shaped his affairs as to permit him to place all his investments near "M."

At length a year had passed since Mr. Baring had been at home, then month after month dragged along it was two. Deep shadows began to dwell on the fair face of the faithful wife, but not a word of distrust or condemnation of the absent one fell from her lips. To every one she said: "The separation was dreary, but she hoped it would soon end."

Then came a rumor of hotel bills unpaid. The landlord, whose patience had been long drawn out, cut it short at last by the intimation that the best rooms in the house could no longer be held unless paid for. She quietly secured a room in a house of a friend near by, confidently assuring him. however, that her husband would soon come and pay all.

Her wardrobe, once elegant and complete, began to show signs of decay, though with painstaking skill the excellent materials of which it was composed were transformed into new shapes and the best portions brought to the front. But, as time went on, the worn spots would not be concealed, even by the most artistic needlework. And despite her resolute courage and indomitable will the lines of anxiety would show in her face. But such was her proud carriage and dignified mien that no one dared to go to her with the question. "Do you need help?"

Always, when asked concerning her husband, she said: "He will come soon I am sure," though her voice grew plaintive, and fear rather than confidence was implied in her tones. She had ceased going to the hotel for her meals and was cooking for herself in her room, though this fact was never mentioned by her nor to her. Yet invitations to dine and to sup were given her more frequently than before, and baskets of delicacies, always accompanied by a gift of flowers, found their way to her room.

But a time came when the club members could no longer disguise their efforts to relieve. Mrs. Baring was ill, and at once they were at her bedside, grieved at the actual want in which they found her. At once they brought food, medicine, nurse, physician, clothing, everything that was necessary to her comfort. And withal they gave their loving, cheering, inspiring presence.

When she recovered they set about devising ways and means of providing for her necessities without seeming to dole out charity. The baker, the butcher, the grocer were each provided with a sum of money and instructed to inform her that these amounts had been placed to her credit by an unknown party. Her imagination caught at a suggestion that this had been done by her husband for some unaccountable reason.

The pitiful and painstaking economy with which she drew upon this provision, to make it last until he came, proved her innate integrity.

Until he came. This was the burden of her thought, and at last, at last, he came.

One fearful stormy night he stood at her room door, a forlorn, dejected, aged, miserable wreck of his former self, waiting a word of permission from her to enter, waiting to be drawn in, wept over and forgiven.

The story he told she never spoke of, never betrayed by so much as a quiver of an eye, nor did her faithful friends in any way make known to her that they had learned, at an earlier date, the reason of his absence.

Baring had lost heavily in some of his financial operations and, in the midst of his perplexities, hoping to have time to make the amount good. had used funds belonging to other parties. The law called this embezzlement, and condemned him to serve a term in a penal institution from which he had just been released.

What it cost that proud soul to receive him after such a confession can never be known. But he was so humble, so abject, so humiliated, so helpless, that she could not but be merciful. It was not in her to do otherwise. She cared for him through a long and violent illness with all her old-time tenderness and devotion. Her club friends stood by her faithfully, and when he was able to be removed provided for them a small cottage home. Never in her happier days was she met with more cordial greetings, never with such unwearying attentions.

"I must work," she said, "give me something to do by which I can earn our bread. You are too good to us."

And they brought her fine sewing, lace work and embroidery, and paid her in proportion to her needs rather than the market value of the work. This contented her. Never before had she served others for pay, but she did it now, diligently and faithfully

But before the winter came again, Baring had partially recovered his strength and was gone, "to seek employment in a distant city," she said, "he would send for her when he obtained a position."

But another call came to her first. During the cold weather of '98 her struggle for life , her toils and humiliations were ended.

Faithful to the last, the members of her club stood by her. Theirs was the love that endured to the end. They laid her to rest with flowers, and music and sacred ceremonies, and the tears of friendship bedewed her grave. The lonely mourner afar off, unable to come because of poverty, sent his thanks to the club, no member of which will ever regret the sacrifices of time or money this beautiful charity may have cost them.

TO CURE A COLD.

Consul-General Guenther of Frankfort, Germany. tells of a new cure for a cold. It consists of a mixture of cocaine, paranephrine, and water, applied on cotton to the nose. It arrests secretions and cures the cold, usually, by several applications. Inasmuch as colds can lead to dangerous diseases, it is wise to prevent its protraction. In the case of children, Doctor Vohsen, advises Mothers to cut a small rubber tube obliquely and to insert the sharpened end into the nose, then, by means of a rubber ball, blow air into the tube. Thus the secretions in one side may be blown out through the other side. This eases the children and allows them to breathe freely. One can see at a glance how valuable such knowledge is. It can be used in all kinds of cases affecting the nose and throat.

THE HABIT OF SPITTING.

Boards of Health throughout the country are inaugurating a campaign against spitting on the sidewalks and in cars. The women, rightly too, are protesting through clubs and kindred organizations against this vile and vulgar habit.

Discussing this subject with a lady on the car recently, she made this pertinent observation: "If men were compelled to wear skirts I think they would see the necessity for stopping this vulgar habit. It is disgusting to women, and disgusting in the extreme." The American man, the most cleanly, as a rule, of the male class, seem the most indifferent to this habit. It would seem that they ought to have the truth forcibly impressed upon them that miscellaneous spitting is a habit simply disgusting in its nature. As things are, the American man spits without any regard to place; on the sidewalks of our streets, in cars and trains, in halls and entries—everywhere. It is a habit peculiarly American, and anything but creditable to our sense of propriety. In European capitals the sidewalks of the streets are immaculate in comparison with those of this country. Our cities are a positive disgrace in this respect. Nor is this true of our cities alone. The places of meeting of men in the smallest village present the same appearance. The sidewalks in front of the rural general store or post-office is made almost impassible to women by this offensive practice. Devoid of every instinct of decency as the habit is itself, it is perfectly revolting to a woman's sense of refinement. It is she who is most offended and injured by it. She can not constantly keep her skirts free from the sidewalks, and yet if she wishes to avoid bedraggling her garments she must do so. Men do not appreciate this. If, as I have said, they were compelled to don skirts for a while, I think their expectorations would soon stop. But as such a change is not probable it behooves every man to do what he can to correct the habit in other ways. He must correct himself if he is guilty of it, and for those of us who are not the time has come when we should awake to the realization that we owe some duty to the women of our homes in this matter. The practice has gone altogether too far.

WANTED
A Bright Young Man with Light Team in your county. Steady work and good wages for the right man. References required. For full particulars, address
KOCH V. T. CO., Box C, WINONA, MINN.

Women have inwardly revoltd at it; at times they have publicly cried out against it.

In the cities of Denver, Los Angeles and San Francisco, as well as in many smaller cities in California, Boards of Health have adopted stringent measures to stop the habit. But with all their efforts it is not abated as it should be.

Let the woman's clubs all over the State take up the question of a more stringent enforcement of the ordinances and the reform, which appeals to every clean-minded man and woman, will soon spread. It is a work in every way calling for the attention and action of Boards of Health and all bodies and citizens interested in the health of communities. The spitting habit is an absolute menace to the public health.

ADVICE TO WOMEN WHO BUY MILK.

Don't conceive the notion that all milk men are dishonest. They are not. Some are rascals, but not all.

Be sure to avoid taking loose milk from the open can. Always select bottled milk if you are assured that the bottles are filled at the farm or at the distributing dairy. Measuring out in the street dust is a disgusting practice, but still another element of danger is added by the use of the bottles thus filled. The bottles are not sterilized, may not even be properly washed, and may come from houses where contagious diseases have occurred. Having selected a dairy, be loyal to it; if you have complaints to make, see that they reach headquarters.

Whether in country or city, the householder is not to put her reliance on any so-called "tests." She is not to buy a lactometer or a neat little case of chemicals. The average woman has neither time nor training for such exact use of these appliances as alone can give value to results.

Look carefully at the bottom of your jar for sediment. If you value the health of your family don't overlook this caution. The most ignorant can judge of this condition.

Sediment in milk means unclean methods; it is not to be tolerated. "Hold back the last spoonful in pouring" is a common household rule—far better, send in your complaint to the central office. An unpleasant or "cowy" odor is also ground for suspicion; it means barnyard filth.

See that the milk bottle is put on ice as soon as delivered; that utensils used for milk are used for nothing else; that they are washed, scalded and drained, without wiping. Wipe off the mouth of the bottle before pouring out. Protect from dust and flies as well as heat. In cool weather keep in a well aired place rather than the ice box. Use only glass or crockery as containers. Good milk should keep twenty-four hours. If it does not there is something wrong in the method of the milkers or in the jars used. But in every event insist on clean milk, and if you can not get it report to the Board of Health.

COUNTRY AND SUBURBAN HOMES.

The foundation of human happiness centers in the home life of the people. With a beautiful country or suburban home the professional man or merchant soon forgets the worries of city business in the enjoyment of his home surroundings. There is in America a growing tendency towards the separation of the home and business life, for when one spends eight hours each day with the rush of business, both the body and the mind call for a rest. Modern transportation facilities have enabled the brain worker to take this rest in the surburbs amid nature's surroundings. Here the "world forgetting, by the world forgot," we can enjoy life in reality, for here is the one place of earth which is our very own. For however much we may enjoy traveling in foreign lands or the pleasant hours spent at an opera, yet with all these "there is no place like home."

But as "a thing of beauty is a joy forever," if he would get the most enjoyment from our home life, we must beautify our homes to the fullest possible extent. This is best done by attention to the grounds surrounding the house, which in the country may be of good size. For we may have a costly house, elegantly furnished, yet if the surrounding grounds are not planted to nature's green sward, with flowering shrubs, trees, and flowers in harmony, our home will lack the inviting, restful appearance so essential to make it what it should be. The house should be the center of the picture presented to the eye, which a harmonious framework of grass, shrubs and flowers will bring forth in all its beauty.

PICKING CALIFORNIA VIOLETS IN DECEMBER.

No other flower is so closely associated with the house as the violet, for in every California garden they may be found massed around the foundation or used as border plants leading up to the door. None other diffuses such a delightful fragrance during the winter months.

MOUNTAIN-TOP FLOWERS.

On the snow-capped peaks of the Rockies, miles above the sea level, and far above the clouds, the stony summits are gay from Spring to Autumn with the colors of the wild flowers that bloom in that dizzy world. Clinging to granite ledges, peeping from dark crevices and hiding in the spruce woods, are found some of the most delicately beautiful of Nature's petaled children. They are not often seen, because comparatively few persons who have visited their haunts.

BE ORIGINAL.

As cities came to usurp the freedom of country life, and ground became too expensive for front yards, city people who loved flowers and whose front yards were only brick sidewalks, were obliged to put their plants and seeds in the rear, if they had any at all, and so grew the fashion of back door flower gardens.

A silly country man who visited his city cousin observed the rear flower growing, went home, despoiled his front yard and did his utmost to conceal his shrubs and blossoms, as if they were things he was very much ashamed of, until the passer-by in the country no longer looked on beautiful flowering shrubs and cheerful annuals, but instead beheld stretches of bare green grass, like a meadow until the sun of summer came and scorched it brown, when it became a tangly, withered offense to the human vision. How prettily a bit of bright color might have relived this somberness, but the eye sought for it in vain. Imitation is said to be complimentary, and may sometimes be forgiven, but the floral faddist should not be encouraged.

SCOTCH HEATHER.

The heather in Scotland, when the snow begins to melt, is burned off by the shepherds to promote the new growth of tender herbage. It is said to be productive at times of the most beautiful nocturnal appearances, of many colored lights and sounds of explosion in volcanic effect. In the "Lady of the Lake," Scott beautifully describes the heather on fire.

ANOTHER USE FOR THE CACTUS.

A new soporific, to which the name of pelottin has been given, has been discovered in a Mexican cactus named Analonium. The native Mexicans eat slices of the plant, which they call "pelate." Its hypnotic alkaloid has been separated by Dr. Hefter, of Leipzig. One grain of pellotin is equal in its effects to fifteen and a half grains of trional and to thirty-one grains of chloral. In large doses pellotin is found to be effective in quieting victims of delirium tremens.

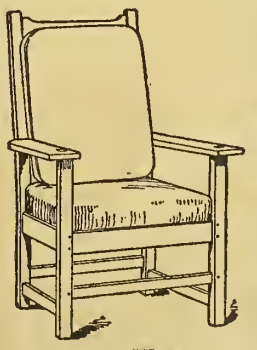
"Dependable Furniture at a Fair Price"

True Mission Furniture



The Old Mission styles of furniture are the most favored and the most used now. The plain, simple lines and the peculiar finishes of the weathered oak and the dark rich mahogany are decidedly pleasing and are in strict keeping with the bungalow form of architecture which is so popular in this section of the country. There is a great diversity of style and finish even in these special lines and just as great an opportunity exists for inferior workmanship. The mission furniture from the factory of the famous craftsman, Gustav Stickley, is acknowledged to be the finest in the country—made entirely by hand even to the smallest parts and every joint is mortised and pinned and made to fit perfectly. We are agents here for this superior furniture and constantly carry a very large and selected stock. All mail orders given prompt attention.

WOMEN AS SQUAB RAISERS.

(Continued from First Page.)

feeding and watering in the morning, examining the nests to see that every thing is all right and a similar process during the afternoon. For the ten pens this work would consume about one hour each day and should be performed regularly.

The pens should be kept clean, fresh nests be supplied the birds as they are ready to lay again and a thorough cleaning of each pen at least once a month, which may be on any day that is convenient for the attendand, and would require about half a day for each pen.

Trusting this will answer many of the beginners' questions we may be able at some future writing to give in full detail the work of a squab plant in running order.

About Lumps

IN

Woman's Breast

[San Francisco Cal., Nov. '05]

DR. S. R. CHAMLEY, the acknowledged authority in America on Cancer says in his book on "Cancers and Tumors Cured without Knife or Pain" that any lump in woman's breast is Cancer.

The book teaches that any tumor, lump or sore on the lip, face or anywhere six months is Cancer.

The Doctor offers $1,000 if he ever fails to cure any Cancer he treats before it poisons deep glands and charges nothing until cured. No X Ray or other swindle.

The book is full of testimonials from ministers, doctors and millionaires, many of them right here. Leading newspapers and medical journals the world over have given him great praise; no man is doing a grander work for humanity. He has been curing Cancers over a third of a century, Investigate his absolute guarantee.

The book is sent FREE to those who describe their Cancer, 50 cents to others. Address,

25 Third St., San Francisco, Cal.

F. E. Twining of the Stockmen's Supply company of Fresno, has issued vol. 1 No. 1 of Stockmen's Bulletin. It is issued for the purpose of advertising the goods of the company but at the same time has much valuable information to the stock grower and dairyman. The leading article of this first issue is on milk fever, with description of disease, symptoms, appliance for cure and method of using it. The stock of goods carried by the company is large and contains nearly everything the stockman or veterinarian might wish for treatment of diseases.

San Francisco Markets.

San Francisco, Dec. 6, 1905.

Butter.

Quotations in the butter market were of satisfactory proportions yesterday and the general undertone was steady. Available supplies of fresh lines of butter fully balanced trade wants and offerings of extras were well absorbed at the quoted basis price.

Lemons.

Flower, fy	$2.75
Flower, xc	2.50

Foreign Lemon Sale.

Seven thousand boxes of Sicily lemons were sold at the foreign lemon auction today. The cargo was in generally good condition. Prices realized, however, were lower than those of the last sale and the market was weaker. Values realized were as follows:

Fancy 300's, $2.20 to	$2.35
Choice 300's, $1.90 to	2.10
Fancy 360's, $2.30 to	2.50
Choice 360's, $2.20 to	2.25

The next foreign lemon auction will be held on Friday, the 8th inst., when 10,000 boxes will be offered.

Dec. 6.—Four cars of California fruit were sold at today's citrus auction. The market continues steady, with a good demand for fancy stock. The weather is favorable, with receipts continuing moderate, there being four cars on track, with seven due.

Moore's ex. fcy, C. C. U., Exeter	$2.55
Mariposa, fy, C. C. U., Exeter	2.85
Mariposa, fy, C. C. U., Exeter	2.80
Mistletoe, ch, C. C. U., Exeter	2.50
Moore's ex. ch, C. C. U., Exeter	2.40

Boston Market.

Boston, Mass., Dec. 6.—Three cars were sold at the auction today. The market is very strong on navels.

Mariposa, fy, C. C. U., Exeter	$2.90

Lemons.

Pet. xc., San Antonio, Ex.	$3.15
Selects, ch., San Antonio, Ex.	2.80
Gondolier, xc., C. C. U., Rialto	2.60

Philadelphia Market.

Philadelphia, Dec. 6.—The market is firm on good stock, with the weather cool.

Forget-me-not, fy., Tulare county Citrus Fruit Exchange	$2.50

Lemons.

Purity, fy., Wilson & Gilman	$2.65
Bridal Wreath, xc., Wilson & Gilman	2.25
Majestic	1.55

BY DR. W. J. OLIVER,
318 East Second St., Los Angeles

To the end that this department may be made as valuable to the subscribers as possible, we ask observance of the following: Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease ap eared. Give your name and address, which will not appear in the paper if you so request. No charge whatever is made for such questions as are answered through the columns of the Cultivator, but when an immediate mail answer is wished Dr. Oliver asks an additional fee of $1.00 and will give immediate attention and reply by mail. In such case write Dr. W J. Oliver, 318 E. Second St., Los Angeles, Cal.

Questions should be in by Monday to be answered in the following Friday's paper.

VETERINARIAN BEST.

EditorCultivator: I have a cow with a hard lump on her throat located at the roots of the tongue. It grows pretty fast and discharges with a strong, nauseating odor, will you kindly tell me through the columns of the Cultivator what it is and give me a remedy that will cure it. O. F. H., Downey.

This is a case of actinomocosis and is unsatisfactory to treat. The growth if not attached to the bone, should be dissected out and the wound cauterized with a hot iron. Rub in corrosive sublimate over the diseased surface which will cause the diseased tissue to detach from the healthy, in from three to four days. Then keep clean and apply carbolized oil to the sore.

FAT FOR BUTCHER.

Editor Cultivator: I have recently secured a cow that is worrying me. She dropped her second calf last June and now gives but from five and one-half to six pounds of milk (rather rich) at a milking. Her udder is very small and covered with long soft hair. She has always been fed about two and one-half to three quarts of bran and a tubful of mixed wheat and oat hay morning and evening. Would you recommend the use of oil cake meal added to the bran and substituting alfalfa for hay or using some alfalfa meal with this hay?

Her former owner (and myself too) was advised **not** to breed her until next January or February so as to have her calve in the rainy season. But this (eighteen months) seems to me too long a period. W. W. S., Campbell.

Your cow will never be a good milker. Would advise drying her up and getting her ready for the butcher. You should breed a young cow within three month after calving.

POSSIBLY TUBERCULOSIS.

Editor Cultivartor: Can you tell me what is the matter with my cow? A lump formed in the left back teat, up near the udder. It grew larger until in three days from formation, it stopped the flow of milk from that teat, and felt about like a marble half an inch in diametcr. The teat has gone dry but the lump still remains.

The milk looked natural as long as it came so it could not have been garget. Don't know of its having been bruised.

She has been on young barley and alfalfa pasture with an occasional feed of alfalfa hay, but no grain. J. B. H., Holtville.

The lump which you describe may be of a tuberculosis nature owing to such rapid growth. If so, the milk would be unfit for use. I would advise having the cow tested with tuberculin and if it proves to be not a tubercular deposit, then should advise having the lump divided by a teat bistory.

CLIMATE AND CROP SERVICE.

United States Department of Agriculture, Climate and Crop Bulletin of the Weather Bureau, California Section, for the week ending Monday, December 4, 1905.

General Summary.

The weather was cool, cloudy and unsettled most of the week in all parts of the state. Light to heavy frosts occurred in nearly all sections, but caused no material damage. The storm of last week was followed by heavy rain in the central and northern sections November 29, with severe thunderstorms in some places and unusually heavy snowfall in the northern foothills and mountains.

In Southern California the seasonal rainfall is much above average and is ample for present needs. The soil is thoroughly saturated and in some places is too wet for cultivation; streams are running and water is rising in irrigation wells. Early sown grain is making good growth and green feed is abundant. In the central and northern sections the precipitation has been less than in the south and has come later than usual, but enough has fallen in the past two weeks to enable farmers to resume plowing and seeding and start pasturage. More rain will be needed soon in the San Joaquin and Sacramento valleys. Farm work of all kinds is progressing satisfactorily. Stock suffered considerably from the long drought, but are rapidly improving.

A few days of bright sunshine in Southern California caused a rapid improvement of citrus fruits, but oranges are coloring slowly and harvesting is somewhat backward; prospects are good for a large crop. Orange picking and shipping continue in the Porterville and Oroville districts, where the crop is good and of excellent quality.

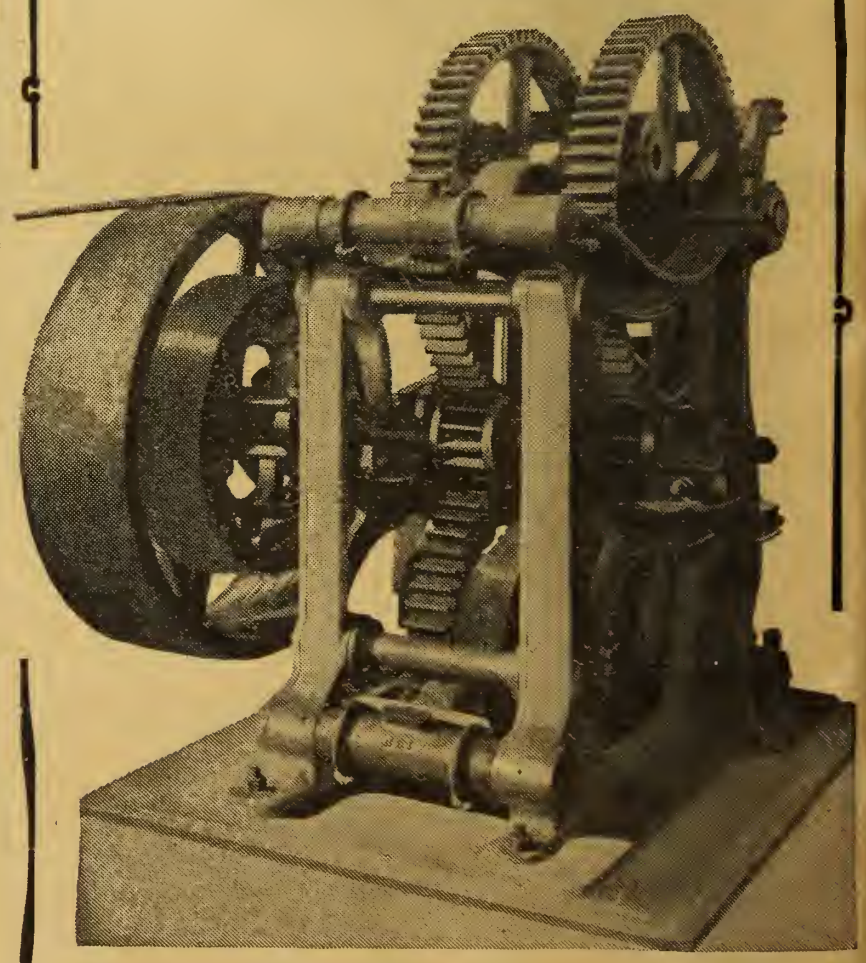
The Record for the New Pomona Pumps

FOR 1905

Not a Broken Rod, Not a Plunger Pulled for Repairs



The irrigation season just closing has demonstrated fully the high merit and efficiency of the New Pomona Pumps.

Every one installed has passed through the season's run without breaking a rod or requiring the valves to be pulled for repairs, proving conclusively that the ideal beam motion used by these pumps is more than has been claimed for it.

The slow, uniform motion upward and the quick, smooth down motion handles the rods without any jerk or jar, while the long lap of the plungers in passing the dead points, keeps the water column in continuous motion upward and a steady stream flowing from the discharge pipe.

They have passed through the experimental period and are built better than ever for next year.

The ideal pump for irrigation purposes. Send for catalog.

PRUNE ORCHARD IN NORTHERN CALIFORNIA.

In Central and Northern California the prune crop is the leader of all from deciduous fruit trees and the past season has been one of most unusual success. The crop was well distributed throughout the season and the prices were uniformly good. California prunes are today better appreciated than ever before.

PEACH ORCHARD NEAR NOVATA, MARIN COUNTY.

Although this section is noted almost entirely for its extensive dairy interests, its valleys and lower hills are dotted with some of the finest deciduous fruit orchards to be found in the State. During the year 1905 one thousand, nine hundred and forty-six cars of peaches were shipped out of California.

CALIFORNIA CULTIVATOR

A WEEKLY JOURNAL DEVOTED TO AGRICULTURE IN ALL ITS BRANCHES.

Vol. XXV—No. 24 LOS ANGELES, CAL., FRIDAY, DECEMBER 15, 1905 Subscription $1 a Year

California Fruit Growers in Session

By C. B. Messenger

Governor Pardee, in his address to the State fruit growers this morning, said: "Only the great interests and great importance of the fruit industry accounts for the representative men from all over California gathering in this convention to discuss the matters of vital importance to the industry." The governor referred to the time when Daniel Webster, standing in the senate of the United States, balanced a large copper cent on his index finger and said he would not give that for the agricultural resources of California, and yet today it takes 50,000 cars to transport the annual soil production of the State. The value of fruits upon the trees in this State is estimated by many at from $50,000,000 to $80,000,000.

And yet it is only since 1888 that fruit has been forwarded under refrigeration. The refrigeration has vastly increased the range of our markets and now other possible improvements will still more extend them.

The governor urged the greatest of care in packing and manner of preparing our fruits for market and referred to a successful Southern California grower of oranges whose prices are exceedingly satisfactory, a result which has been secured by greatest care in packing and in seeking the best of markets.

California can produce many, many fruits which no other section can produce. Our oranges, lemons, figs, walnuts, raisins, even apricots have but few competitors. California can rule and control these things if it will be honest and careful in packing, then keen in seeking markets.

The secretary of agriculture, the State horticultural commission, the University, all will lend aid in securing information as to methods of getting best results.

Above all, the governor felt there is no danger of overproduction. With the 6,000,000 of acres in the great valley and the four or more millions of tillable land in its foothills, still, with increasing demand and shrewdness in seeking a new market we will find an outlet for it at remunerative prices.

The large gathering gave hearty applause in appreciation of the governor's speech and to a man arose to their feet in a vote of thanks to him for appearing before the convention.

* * *

The convention opens most successfully and with a large attendance. The local attendance is much larger than is usual and is to the credit of Santa Rosa horticulturists.

There is a feeling of expectation as to whether the endorsement of rate legislation by the national congress will call out a fight by railroad interests. The feeling is now that it will not.

Elwood Cooper is in the chair and in opening he remarked that he had formerly presided at a State convention in this city, just 18 years ago, and quoted from his address at that time. His annual address today, followed much the same lines as formerly, giving much emphasis to the needs of the pure food law. He referred to the present prosperous condition of fruit growers, especially lemons and late oranges, to the light crop of nuts, to pear blight, which has been less virulent during the past year, to the necessity of putting up prunes so they will not mould in boxes, to the successful introduction of caliephialtes, the insect which is hoped will rid the country of the apple worm, and to marketing and transportation problems.

* * *

Russ Stephens is here, of course. He got in the first motion, to have a committee appointed on transportation. Edward Berwick is also loaded with Parcels Post arguments and is greeted with applause for his "We-want-our-pudding" story the same as in the past.

A. R. Sprague, chairman of committee on co-operative fruit marketing, made report. He referred to the appointment of his committee at San Jose last year, and to the instruction to secure a vote of prune growers on the question of co-operative prune marketing. The committee had submitted three propositions, (1) "Whether or not they wish any organized control of the market in the interest of the grower." (2) "If voting yes, do you prefer the profit-sharing plan, viz: to contract to sell your prunes for cash on delivery, for a period of five years, at a price slightly above the present market rate, with an agreement that all profits in marketing shall be equally divided between the marketing company and the growers, each grower receiving his proportion of profit according to the tons of prunes delivered." (3) "Do you prefer a purely co-operative organization."

* * *

The series of questions was submitted to 3,500 growers, but only 210 returned the cards. Of these 116 voted yes on the purely co-operation plan and seven voted no. On a plan of abiding by the vote of the majority and all co-operate only eleven would consent. This discouraging result was at a time when the market was at its worst so that a large return might have been expected.

Mr. Sprague reported more favorably regarding the condition of green fruit and olive growers in the matter of co-operation.

* * *

This afternoon's discussion on apples will be of great interest to apple growers and some of the papers will later appear in The Cutivator.

Countesy Sonoma County Board of Trade.

Diversified Farming Near Santa Rosa.

A good work is planned and as formerly noted in The Cultivator, some fine speakers are on the programme.

Santa Rosa has a good committee of arrangements and the hall and entrance are nicely decorated.

John Isaac, is of course, in the secretary's chair, and has all details in hand.

The directors of the California Raisin Growers' Company have called a mass meeting of raisin growers to be held in Fresno, on Monday, the 18th, for the purpose of submitting to the growers the existing condition of affairs, and ascertaining their views and desires on the subject.

TREES

CALIMYRNA FIG

There are a great many sorts of Smyrna Figs. We catalogue six kinds, but these do not comprise our entire collection. There is only one variety, however, which five years production on a commercial scale warrants us in recommending it for drying purposes, and this particular variety we have designated as above to give it the distinction it deserves. When you buy your trees from us, you know you are purchasing stock originating from pedigreed trees, which have been producing the highest grade of fruit for a period of years. When you purchase a thousand peach trees, you usually designate what you want. You certainly would not permit your nurseryman to send you a lot of varieties, without labeling them, if you could help it. Well, it is the same with the Smyrna fig, some are early, others late, some are purple, others green. Can you afford for the sake of saving a few cents to take chances on buying trees, which cannot be relied on. We were the first ones to demonstrate the value of this fig, and with our seal we guarantee the genuineness of our trees. Prices lower than ever before.

FRUIT TREES

Are grown on a deep, alluvial river bottom, virgin soil, consequently the root system is as perfect as good soil can make them. Our assortment of apples, pears, peaches, prunes, apricots is more complete than ever.

S AND LEMONS

Our stock is grown in Exeter, the famous thermal belt of Tulare County. The soil is a rich, deep, black loam, just the kind which develops the highest grade of fruit, as well as the most perfect type of tree. Our assortment consists of all standard varieties of Oranges, Lemons, Pomelos, Citrons, Limes, etc. Carrying out the lines already established in the other branches, we do not confine ourselves to one or two standards and no more, for although it costs money to keep up a stock of many varieties, we want to be on top in this, as well as in everything we specialize in the nursery business.

GRAPE NES

If you do not know it, you ought to know that we are the largest growers of vines on the Pacific Coast. We are not only growers of raisin, wine and table grapes, but we are also making a specialty of vines grafted on Phylloxera resistant roots. Our great and enterprising neighbor, Mexico, is having its vineyards devastated by this pest, and we have already sold two orders to prominent vineyardists there, who know what our stock is, consisting of eighty thousand grafted vines. How did we get such orders? Because we had pleased our customers before, so they had no hesitation in patronizing us again.

ORNAMENTAL STOCK

Our stock of Texas Umbrella trees branched in all sizes, guaranteed absolutely true to name, is better than ever. We are extensive growers of Poplars, Mulberries, Maples, and all deciduous ornamental trees suited to our conditions.

In evergreens, we have Acacias, Eucalyptus, Palms, Roses, Greenhouse plants, in fact everything you want for your garden.

OUR NURSERIES

Eleven hundred acres in four distinct places. Expensive to run a business so widely distributed. We know it. Why do we not concentrate all in one place? Because we want to be in the position to grow the best of everything, and to do this, must select the soil to suit the tree, shrub or vine. No use to grow a tree where you know beforehand the conditions are not favorable for its perfect development. That is what twenty-one years of experience does. It places us in the position to grow the very best stock. In making a plea for your trade, we do so, not because we have the cheapest stock, but on the ground that when you favor us with your business, you will get the best which money, brains and experience combined can grow.

CATALOGUE

We will mail our large profusely illustrated Catalogue, English or Spanish, to any address on receipt of 5c postage. Price-list mailed on application.

PAID-UP CAPITAL, $200,000.00.

California Horticulturally

By John Isaac, Sacramento, Cal.

WORK ON THE PEAR BLIGHT.

Prof. W. M. Scott, for five years Entomologist and Pathologist of the State of Georgia, and who has been first assistant to Prof. W. B. Waite, in his work with the pear blight for some years, is now in California and will work with Prof. Waite against this scourge of our pear orchards during the latter's stay here, and then take entire charge of the work during the winter when Prof. Waite will have to transfer his services to other portions of the Union. In an interview with Prof. Waite he states that the work of fighting the pear blight pest has been carried on in good shape and that he hopes to have the methods of doing the work in the right manner so thoroughly known in a short time that the disease will be practically stamped out. His work is entirely educational and consists in teaching others how to recognize the blight on sight and how to best check it. To this end he has worked with students of the university and members of the Horticultural Commissions in the affected sections, and through these he will reach the growers, until all will be able to recognize the disease and know how to operate against it. When this is done the pear blight will have lost its terrors.

* * *

ASSOCIATION OF OLIVE GROWERS.

The olive growers of Sacramento Valley recently held a convention in the city of Sacramento for the purpose of effecting an organization, which they did, confining its membership to those only growing olives in the Sacramento Valley. Olive products—oil and pickles—have become a very important branch of industry in the northern part of the State, and Oroville boasts one of the largest establishments devoted to this branch of industry in the State. The organization of growers having for its object improved methods of cultivation, the exchange of ideas as to methods, and the co-operative handling of the crop cannot but be beneficial, and if successful the association will probably find itself forced to extend its field beyond its present limited area. California is the only olive producing State in the Union, the interests of all the growers are identical, and the leaving of any section on the outside of an organization cannot but weaken it. It is to be hoped that the Sacramento Valley Olive Growers' Association may meet with ample success, and yet be compelled to changed its name to the California Association.

* * *

PATRONIZE RELIABLE NURSERY MEN.

The tree planting season is very close to us again, and a few words of advice to prospective orchardists may not be out of place. Tree agents will be numerous and will make every effort to sell their stock. If these represent some well known and reliable nursery it is all right, but unless they do, the less business had with them the better. It is too often the custom of tree peddlers to fill an order for any kind of stock, whether they have it or not—in fact, there is no variety which they do not have, according to their own statements, and often they fill orders for several varieties from the same bunch. It is a great loss of time and often of money to spend several years in cultivating and caring for a young orchard only to find when the trees come to bearing that they are not what were ordered nor what were wanted. When the discovery is made, it is likely that the agent or peddler from whom they were ordered may be out of the state or working some other field, and in any event be wholly irresponsible. Therefore, it is the best part of wisdom to purchase stock from some reliable nursery, or its agent, and then if things are not as they should be there is a chance to make a satisfactory amount of fuss about it any way, and it never pays an established concern to deceive.

* * *

GEORGE COMPERE WILL SOON RETURN.

George Compere is now on his way from Anstralia to California, and will probably be in San Francisco on the next steamer. It was hoped that he would arrive in time to make a report of his labors to the fruit growers at their convention in Santa Rosa, but some delay has prevented this. A great part of Mr. Compere's recent work has been in the direction of discovering a successful parasite for the purple scale and another for the red scale. He has succeeded with regard to the purple, so far that he found a very active and effective parasite of this pest in China and has introduced it into California. It is now being bred and cared for in the insectary of the State Commission of Horticultural in San Francisco, and great hope is entertained that it will prove effective in checking this, the worst of our scale insects. He has already introduced a lady bird which feeds on the red scale, and which has been established in some of the infested sections. This does good work on the red scale and, even if it does not prove an effective check, will at least be a great aid in checking the pest. The fruit growers are anxiously expecting a report from Mr. Compere, and they will not be disappointed in it.

* * *

EARLY NORTHERN ORANGES.

Northern California does not grow very many oranges as compared with the South, nor has the same care and attention been bestowed upon this crop there which characterizes the south, but those who have given oranges the proper care and have produced marketable fruit, have made good money. The one great advantage which the northern orange grower has over his southern brother is in the earliness of his crop. Orange shipments have been going forward since the middle of October, and the height of the season is now on. There will probably be some 2,000 cars of fruit shipped from north of Tehachipa, and most, if not all, will be shipped out before New Year's. Prices have so far been very good, ranging from $3.50 to $3.75 per box, at which price it pays to grow oranges.

* * *

NEEDED RAIN.

Rain has at last fallen in the northern counties, and not before it was badly needed. Last season the first rains fell in the middle of September and these were copious and well followed, so that the whole country was green and feed abundant by the middle of October. Up to Thanksgiving between seven and eight inches of rain had fallen, and there was no period of drought during the whole season. This year no rain worthy of record fell until the end of November, and so far less than an inch has fallen. This has been especially hard on the stock, sheep and dairy men, who are suffering for feed for their animals. It has very seriously retarded the work of the wheat farmers, and little if any plowing has so far been done. Aside from these, however, no damage has resulted from the continuous dry weather, and if the storm which came last week is followed there is no good reason why we should not make crops of all kinds. It is the late, and not the early rains that count in California, and with abundant precipitation between now and May we shall have a good season in spite of its tardiness.

The Cananea Consolidated Copper Co. have just installed a mile of 8 inch bored fir pipe for conveying a water supply to their concentrator at Cananea, Sonora, Mexico. This pipe was made by the National Wood Pipe Company, Olympia, Washington. It is bored out of a solid log in 8 ft. lengths, the bark and sap being turned off from the outside. This is then banded with 1 inch flat steel spaced according to pressure for which pipe is to be used, and the entire outer surface covered with a preservative coating of tar and sawdust. This is the ideal pipe for alkali and mineral conditions.

HOW PLANTS GROW.

It will pay any one of the boys on the farm to take a little time and trouble some time, to ascertain for themselves just how plants grow. Take, for example, a hill of corn three or four inches high, scrape off the surface carefully, take a bucket of water, or several of them if needed, and wash away the soil from the roots so as to expose the roots as much as possible, and study them. They will be surprised at the extent of the root system of a corn plant even four inches high. We will tell them, for they perhaps might not suspect it, that the tips of the plant root exudes or discharges an acid which has the power of dissolving to a certain extent the mineral matter of the soil. Plants take no solid food. There is ash in the mature plant, woody fiber, as well as grain, but the materials of all these must be taken up in liquid form. Plants do not eat, they drink.

They will find in examining this plant that the large roots are simply conduits, pipes to take up this liquid matter, this dissolved food. They will find that the food is mostly taken up by what is called hair roots. If they will pull up another hill of corn and shake off the dirt they will find a good deal of dirt sticking very closely to the hair roots. These are simply elongated cells which push out from the roots and almost glue themselves to the fine particles of dirt. If the boys study this awhile, they will see for themselves how exceedingly important it is to have a properly prepared seed bed, a seed bed in which the particles are in such condition that the roots can move freely and that these hairs roots can come in the closest possible contact with the largest amount of soil.

The plant, however, feeds from the air as well as from the soil. The boys have all noticed that when corn comes up the stalk is round and hard and pointed. This is to enable it to push its way through the soil. As soon, however, as it comes in contact with the sunlight it begins to turn green, then unrolls itself and spreads a large amount of leaf surface to the air. Why does it do this? To breathe, for the plant not only drinks but breathes. They will notice further that all healthy plants have green leaves. When corn begins to turn yellow it is sickly. This green matter is called chlorophyll. It is the workshop of the plant. This green coloring matter is enabled during the day time and when the sun is shining to take the carbon dioxide of the air, dissolve it, and use the carbon, of which plants are most largely built up, for the building up of leaf structure. The boys all notice that corn does not grow much on cloudy days. This laboratory of the plant cannot run except with the sunlight. The more sunlight, when there is plenty of moisture, the more rapid the growth.

The carbon taken up from the air, together with the soluble solids taken up by the roots, circulates in the plant in the form of sap and in this way the plant is built up from day to day and from month to month. Bear in mind that the plants feed from the air as well as from the soil. They drink from the soil; they breathe from the air. The more leaf structure, the larger the factory upstairs; the more root extension, the larger the factory downstairs. The stalk simply connects these two factories and enables them to interchange products, and, so to speak, work together.

Inasmuch as the food from the soil must be taken up altogether in the form of water as drink, one can readily see the necessity of an abundant supply of water and see why it is that the amount of water available, other things being equal, determines largely the extent of the crop. The corn plant, as we have often told the boys, works from planting time until tasseling time simply to get a good ready. It is simply building up the workshop downstairs and upstairs, but when it tassels out and silks begin to form, then it gets down to business and four-fifths of the dry matter of the total plant is created between tasseling time and the full harvest. This is the reason why a scarcity of water at this season either above or below means a short crop.

CHEMISTRY OF SOIL.

An arable soil in its best condition for producing crops contains seven essential parts: Clay, sand, assimilable plant food, moisture, humas, air, micro-organisms.

Clay furnishes the substantial medium required by the plant as a root-hold, and is also a storehouse for preserving some of its food from waste.

Sand is required to make more friable and porous the too stiff and compact soil that clay alone would yield.

The most important part of the food of the plant that is in the soil consists of nitrogen, lime, potash, and phosporic acid, forming a very small part of the soil, and mostly insoluble, or unassimilable.

Plant growth involves unceasing chemical change in the soil as well as in the plant itself, and this cannot go on without water, nor can plant food be taken up without it.

Humus, or decaying vegetable and animal matter is, as it decays, a source of carbonic acid, which is an important solvent of plant food; humus also itself contains plant food, and it is a loosener of the soil.

Air is necessary in the soil for its oxygen, without which the humus is not formed, and cannot decay. An important feature of this decay is the progress of nitrification; this does not go on without the assistance of micro-organisms.

NUTRITION OF PLANTS.

Nutrition is one of the two primary functions of all organisms. The other is reproduction.

There are different methods of taking food. Amaoba absorbs its food through the walls of its body. In higher forms a body cavity is developed and food is absorbed only through its wall. The culmination of complexity of structure is reached in the highly complicated respiratory and digestive systems of the higher animals.

To understand the relation of nutrition in plants to nutrition in animals, one must go back to primitive methods of taking food.

There are two great operations going on in living beings, one a building up process (constructive), the other a tearing down process (destructive).

These processes may be distinguished,—(a) by the materials used as food, (b) by the structure of the operating organs, (c) by the product of the operation.

There is no hard and fast line separating animals from plants. The method of nutrition prevailing among plants is one of the most decisive characters.

The content of the vegetable cell is primarily protoplasm. This in active cells is differentiated in two parts,—the nucleus, at the center, and the ectoplasm, the lining membrane of the wall. The former displays greater citavity in the processes of reproduction, the latter, in those of nutrition.

SEED POTATOES.

Good seed is one of the essentials to success in growing this crop. As the potato decreases in vitality when grown from poor stock, it is best to either select carefully our own seed by saving the product of such hills as yield the greatest weight of smooth, marketable tubers, or buy from a reliable grower whom we know to be selecting his seed in a like manner.

It is a false idea of economy to save a few dollars per acre by using cheap seed, and thereby ruin your chances of success at the start. The fact that many growers are planting small and indifferent seed, year after year, largely accounts for the low average yield reported, and also for the deterioration of most varieties after eight or ten years in the hands of the average grower.

Small to medium tubers grown from selected seed, that have not lost their vitality by sprouting, will generally produce a more satisfactory crop than larger seed of the same variety grown from a poor strain of tubers that have been weakened by excessive sprouting.

San Luis Obispo County Lands. Best and Cheapest in the State. Rainfall abundant. Colony Lots, Farms, Orchards, Stock Ranches, Town Lots, Business Openings, Mines. Offices opposite R. R. Depots, Oceano and Arroyo Grande, Cal. Call or write for price list.—Beckett Realty Co.

Ranch for Sale

To close an estate, we offer 33 acres near Compton, for sale. Choice alfalfa land. Best artesian well in that section. Water to sell. Address

Phone Main 922 **C. F. LEE, Pasadena, Cal.**

THE VALUE OF QUALITY

When you are considering the purchase of a wagon, buggy, harness, farm or dairy implement, always bear in mind that we have what you want and of the very best quality at the right price.

DON'T THINK

that you save any money in buying an inferior article. A poor wagon will cost nearly as much as a good one and the repairs necessary to keep it in good running order are very expensive.

BUY THE BEST

and you will be better satisfied and have longer wear at less expense than in the purchase of a cheap, thrown-together trap. We carry only such goods as we can recommend to be of first-class construction.

OUR POLICY

of giving full value has been adhered to since beginning business nineteen years ago. We have constantly increased our stock and now have a complete line to offer our customers.

CALL AND SEE US

when you are in Los Angeles. We shall be glad to show you the class of goods we carry. Our ad in the Cultivator of two weeks ago, page 485, will give you a general idea of what we have.

NEWELL MATHEWS CO.,

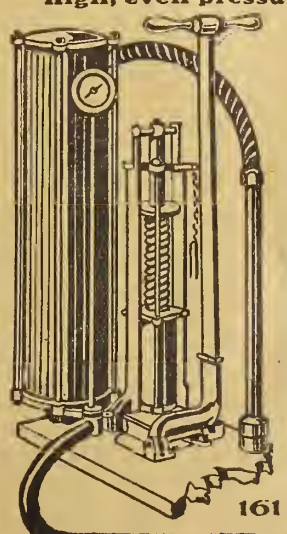
Los Angeles, California

Increase Your Profits

What's the use of going to all the expense of spraying and **then** have poor fruit? The secret of securing clean, fancy fruit is in spraying **thoroughly** with **high, even pressure.** The hired men have seldom done this because the pumps ran so hard, but they do it easily



By Using Bean Magic Spray Pumps

because **they save just one-third the labor.**

In the Spring Rests the Secret

The increase in profit from securing fancy fruit will alone pay for the outfit, and the easy-running, no trouble features found exclusively in the two sizes of **Bean Magic** pumps merit your immediate investigation.

It seems almost too good to be true that all the new improvements can be had in one pump, but it **is** true and you will understand why when you see a **Magic** in operation.

Write for our special offer, freight prepaid, and we will also send our illustrated catalogue No. 16 describing all ten sizes of hand pumps and telling what sprays to use and how to prepare them. State number of acres and kind of fruit. Write today. Catalogue No. 18 describes "Power Sprayers."

Bean Spray Pump Co.
161 W. Santa Clara St., San Jose, Cal.

BY J. W. MILLS, POMONA, CAL.

RECORD OF THE PAST YEAR.

Those who are interested in deciduous fruit growing in California can at the conclusion of any one season generally truthfully exclaim: "The past season was an unusual one," and this exclamation would certainly be entirely true as regards the one just past.

In 1904 the first carload of deciduous fruit—cherries—left California for the East on May 13th, while this year the first carload was shipped on April 22d, being twenty days earlier. This means more than would appear on the surface, for in the places where our fruit is sold, it had to compete with horticultural products from all other districts, and an early year here admits of a greater distribution of our products before the time of heavy competition.

CHERRIES.

It will be seen from this statement that the cherry and pear crops were particularly light, while of the other varieties some were normal and some heavy crops. The shipments of the two varieties first mentioned was lighter this year than for ten or twelve years, and the cause of this shortage is attributed to heavy and continuous rains which fell at the time of the blossoming of the trees thus injuring them so they did not "set" their fruit. In addition to the short crop of cherries, considerable rain was had at the time of harvesting them which further reduced the output. However, returns for those shipped even under adverse conditions, were very satisfactory.

PEARS.

The pears that were available for shipment and for canning and drying, brought exceptionally high prices this year, and for the future for those that are raised, there certainly should be good prices. The pear blight has made its appearance the last year or so in districts heretofore entirely free from it and great concern is felt as to the probable extent of its ravages. It would not be the part of wisdom to plant new pear orchards until it is fully demonstrated whether this disease can be successfully combatted or not. Federal and state officials and experts are now working hard on the problem. It is to be sincerely hoped that the orchards we have can at least be saved.

APRICOTS.

The shipment of apricots was heavier than for any previous season. The markets on this variety of fruit does not expand and it is only in the larger centers that carload lots can be handled to advantage, and even then the distributing capacity is limted. I doubt if the shipment this year will be exceeded for a number of years, unless the season and conditions come so that they can be distributed in assorted carload lots to outside places. Smaller consuming markets that can handle a carload of peaches or pears will comparatively only handle from fifty to one hundred crates of apricots. This assertion in respect to shipments in a fresh state, has no relation to or bearing on their status in a dried state where the facts are directly reversed for the market for the dried product is broadening every year. An improvement in refrigeration and transportation that would permit their being picked riper, and consequently with more flavor and quality might eventually result in their becoming more popular in a fresh state with the consumers.

PEACHES.

Nineteen hundred and forty-six cars were shipped the past season and this fruit, on the whole, found very good markets. This for two principal reasons: first, the earliness of the season allowed a large quantity of them to go into markets before other districts had ripened their peaches; and second, because of the marked shortage of the peach crop in some of the large and competing horticultural centers. The number of cars above referred to was as said before, marketed at very remunerative prices, while for the season of 1904, a late season with big crops in other horticultural districts, only 559 cars were shipped with indifferent results. These facts tell their own story more forcibly than I can and in reply to a number of inquiries I have received on this subject I have invariably replied that some years it would undoubtedly pay to ship moderate quantities of peaches and in other years large quantities could be profitably shipped, but that there would be years when on account of ripening conditions and large crops in other peach growing districts, where planting of this fruit has been greatly increased, it would not pay, and their forwarding would only mean a loss. It stands those who contemplate increasing their peach orchards in hand to plant only those varieties that in the "off" years can be diverted to the dry ground or the cannery.

PLUMS AND PRUNES.

The shipment of plums and prunes was the heaviest with one exception ever shipped from the state. the product was well distributed throughout the season and brought uniformly good prices. The extreme hot spell the first part of July injured some varieties badly, notably Kelsey Japan plums, which prevented their realizing the prices they otherwise would have. California shipping plums and prunes, as usual, are valued foremost in the markets and there will always be a market for a goodly quantity each year, if harvested under normal conditions and well packed, no matter what the size of the crop in competing districts.

GRAPES.

On this fruit shipped this year, results have been very remunerative Many more cars would have been shipped had it not been for the extreme and long continued hot spell the first part of July, which injured them, especially in some of the earlier districts, quite severely. Had the grapes so injured matured and had they been shipped and strung along throughout the shipping season, the several hundred cars so injured could have easily been handled without affecting the prices realized. Based on results achieved the last four years, and using prices as a criterion, I believe grapes promise as much or more for the future than any other varieties of fruit we raise, for the varieties of grapes we raise are not raised in any other place in the United States and the market for them is extending and the demand apparantly increasing yearly.

APPLES.

On apples there was a very good crop this year and the shortage of the Eastern apple crop made possible the widest distribution this fruit has ever had. The splendid packing of the fruit and its unexcelled quality has enabled it to hold its own in all markets.—Lieutenent-Governor Alden Anderson, before the 1905 State Fruit Growers' Convention at Santa Rosa.

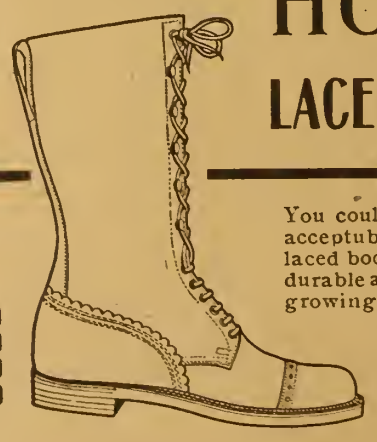
A PAIR OF HOEGEES' LACED BOOTS for a Christmas Gift!


$ 3.50
5.00
6.50
10.00
You could hardly think of anything more acceptuble to the outdoor young man. These laced boots are being made handsomer, more durable and comfortable all the time and are growing in popularity wonderfully fast. We have them in various styles, heights and many kinds of finish from black down through the various shades of tan to pure white; also in variously tinted buckskin effects—some of which look delicious enough to be served on the table. All joking aside, these boots are really works of art, both as to looks and construction; being made over the best lasts and reinforced and made wearproof and waterproof as far as human ingenuity goes in that direction. A pair coming down the pike, with their jaunty lacings of white rawhide, and the pride-of-the-family safely planted inside, is a sight to see.
Send for our outfitting catalogue at once and read carefully.

CITRUS FRUITS

By C. A. Day. Pasadena

FERTILIZER NEEDED.

Editor Cultivator: Last spring I set out a little orange orchard and in September one tree turned yellow, trunk and leaves. Four weeks ago it shed its leaves and some of the others are turning yellow now at the tops and leaves, and are shedding their leaves, whereas 90 per cent. of them look green and apparently in good health. Is it a disease? Had I better dig them up, or is it natural for them to turn that color? What fertilizer if any should I use? I have put on what little barnyard manure I had, but it does not seem to be sufficient. The land used to be desert land, and has never had a crop of it before.—J. M., Calexico.

In reply to the above I would say, if it were the lack of fertility in the soil, the best thing to do would be to take out the orange trees, as the growing of oranges on a soil that has not sufficient natural plant food to grow young orange trees, will not be profitable or successful but from description given I do not believe this to be the case.

The trees where leaves and wood turn yellow and the leaves drop, are probably "gophered." The pocket gopher when not interfered with, is one of the most serious pests of the citrus orchard, destroying full grown fruiting trees almost as readily as young trees.

Burrowing in the ground, it opens up long runs underground in every direction. It is a vegetable feeder and its runs are made partially in search of roots of trees and plants on which to feed. In the case of citrus trees it eats the bark of the roots, girdling the main roots and the trunk immediately under ground. In a majority of cases the work is not so thoroughly done but that the tree, though shedding most of its leaves and presenting an unhealthy and sickly appearance, continues to live. In a majority of cases where the tree has been badly gophered, I believe it best to take it out and plant another. With proper care and precaution it is not necessary to have gophered trees in the orchard. The remedy is first to rid the orchard of gophers and then attack them on adjoining lands. This will prevent the occasional loss of orchard trees. The animal has long runs from adjoining lands, often under roadways, into the orchards. The distruction of the gophers working in the orchard is not sufficient as the runs remain and other gophers will use them; subsoiling is beneficial in destroping the runs. A single gopher will frequently open a run into an orchard ten to fifteen rods in length, sending out lateral runs in every direction and attacking many different trees. It is a night-working animal and frequently comes into the orchard and begins work directly under a tree, where in case of an old tree with branches drooping to the ground, it is not readily discovered until it has practically ruined the tree. Eternal vigilance is necessary and the orchard should be constantly and regularly gone over and a search made for the gopher mounds. Where public roads adjoin the orchard the growth of weeds on either side of the road should be removed and the sides of the road kept clean. An alfalfa patch attracts the gophers and is a harbor for them. In some cases complaint is made that cover crops are an attraction and a harbor. In such cases, additional vigilance is necessary, while the cover crop is on the orchard. The above are precautionary measures and the plan of conducting a campaign against the gophers. To destroy them cats are useful but not sufficient to prevent injury to the trees.

Traps and poison are successfully used. I believe from experience that poison rightly used will be the most effective and is the least trouble. There are different kinds of traps in use but what is called the little box trap is one of the best. To use the trap we first find where there are fresh gopher mounds thrown up and by digging find and cut across the principle run setting a trap in both directions from where the run is opened. In the use of traps or poison one thing must be always borne in mind, the gopher has a well developed sense of smell and readily detects the smell of the human hand on the trap or poison. In cleaning out and enlarging the hole for the placing of the trap or poison, a small trowel should be used and the hand should never be used or allowed to touch the soil. A young gopher is very frequently caught in a trap where the one setting it has been careless, but an old gopher will be shy of a trap or poison on which it detects the faintest scent. Rubbing the trap with a young lemon or the leaves of the lemon tree and pushing some of these into the run will be beneficial in disguising any possible scent of the hand. For poison, strychnine is generally used. I prefer the crystals as the powdered strychnine very quickly loses its strength and is not effective. The poison is used on sweet potatoes, apples or oranges, sometimes grain is used, soaking the grain in the dissolved poison and coating it with candied sugar. This latter prevents the evaporation of the poison. I prefer the orange as it is very effective and the scent of the orange disquises the smell of the hand in preparing the poisoned fruit. Cut the orange in halves, powder the crystals of strychnine with a knife and sprinkle on the cut surface of the orange working it into the juice of the orange. Then sprinkling it over with sugar. When the gopher run is cut push some lemon leaves into the run and place a half orange in each end, the cut face to the run and fill in the dirt, completely covering over the run, and then level all gopher mounds in the vicinity. If no more mounds are thrown up we may safely judge that the gopher has been destroyed.

I have found the strychnine used with the orange effective and have in this way protected my own orchard from the work of the gopher. In many localities, following the heavy rains of last winter, there has been but little trouble from gophers as many of them were drowned by the rains. Gophers are most troublesome in the spring, their season of breeding, when the ground is soft from the winter rains and runs are easily made.

How 10% Gross On Every Car Can Be Saved by Growers

SEASONABLE HINTS.

Do not be in a hurry to fertilize your lawn, the present cold weather is good for the grass, it gives it a resting period. The great disadvantage of fertilizing too early is to force a nice green growth at the time we are expecting our cold weather and the consequence is it makes a spurt, and when it should look nice in the early spring it stops growing and looks brown. It has been forced from its natural resting time and the tender growth is frozen and it takes its rest toward spring when the fertilizer has exhausted its forcing qualities. February and March will be found the best time to manure the lawns and from that time there will be a luxuriant growth until winter.

* * *

Where large beds and borders of cannas, cyperus, papyrus, Caladium esculenturn (elephant ears) have not been disturbed for two or three years, it will be found advisable to dig up the cannas and caladium and store them away until April and the large clumps of papyrus and cyperus can be divided up and replanted in the border when it is spaded up or divided in the spring. The above-named plants can stand any amount of fertilizer, dig up the beds as deeply as possible and turn under from four to six inches of well rotten stable manure, leave the beds rough and by spring they will be in a good friable condition to replant.

Plant the cannas in small clumps about three or four crowns to each, the caladiums the same. April will be a good time to put them in, and during summer and fall you will have a luxuriant tropical effect. Should you not take them up, mulch them well and spade in plenty of manure in early spring.

* * *

Now is the time to attend to the manuring and spading up of all vacant beds and borders. After spading, leave the ground in a rough state, that is don't rake it down, as the sun and air will do more good, and it will leave the ground in a more friable condition than if raked down too smooth. Don't be afraid to enrich abundantly as the ground will be in better condition for spring planting.

THE CHRISTMAS GARDEN IN CALIFORNIA.

The December garden need not be bare, though it too often is, even in California. Violets, started into new life by September rain or irrigation, will fill the air with fragrance. Hardy bulbs, like narcissus and others, freely open their cups and tubes to catch the raindrops. The geraniums are gorgeous. Roses and chrysanthemums still linger—in fact, an innumerable host of blooms may cover the garden, if the planter plans for them. The brilliant red of the toyon, or California holly berries, in their evergreen settings, will always be our formal Christmas decorations, but the California home garden will fill the vases or shower the table with many hues and forms of beauty, without recourse to the conservatory, if one but gardens wisely and devotedly.

There is much garden work to do in December which is, to a degree at least, distinctive. Deciduous trees and shrubs are nearest to dormancy and, therefore, in good condition for pruning and for propagation by hardwood cuttings. Roses, which are encouraged to autumn bloom by the treatment prescribed last July and August, are now entering upon their longer rest, and may be thoroughly handled for shape and for the growth of new wood. Thrust sharp shears, then, into the brushy bushes and cut out, close to the roots, old wood which has done its work and save enough of the younger stems to renew bush-form, selecting both for strength and position, so that new shoots, soon to come, shall have space to develop and contribute to symmetry.

To the skilfull pruner a well-pruned bush has a peculiar beauty, because it suggests future shapeliness and vigor, while to the uninitiated it may be but an ugly bunch of prongs and stubs. Try to realize this and you will find a deeper significance in pruning and learn how to do it rationally. Standard shrubs and fruit trees are, in a way, treated differently from those in bush-form, but the principles of preserving symmetry, renewing wood for vigor and spacing for opportunity are still to be applied. The bright December days, sharp tools and keen interest make pruning study and practice particultrly delightful.—E. J. Wickson, in Sunset Magazine.

NATURE STUDY IN RURAL SCHOOLS.

"Give fools their gold, give knaves their power,
Let fortune's bubble rise and fall;
Who sows a field or trains a flower
Or plants a tree, is more than all."

For country schools, the study of the science of Agriculture and the practice of the art at home provide much for head, heart, and hand. Elementary Agriculture, as a science, puts the pupil in possession of scientific facts pertaining to soil, water, plant and insect friends and foes, cultivation, drainage, domestic animals, etc. Traditional practices of the art must run the gauntlet of scientific tests. The early study of elementary Agriculture fixes the cardinal facts at a period of life when the mind is most impressionable.

When scientific facts are known, the individuals adapt themselves more easily to conditions if he succeeds in his business. The element of pleasure that comes from overcoming difficulties and from seeing long-looked-for results must be in the mind of the laborer; if not, that which is work becomes drudgery. A farmer should work, not drudge.

The introduction of nature study and elementary Agriculture into the rural schools will furnish one means of elevating the child from a life looked upon by many as ignoble to one that is really noble.

BULBS IN GENERAL.

Any time during the next thirty days will do for the planting of nearly all spring flowering bulbs. Hyacinths are best planted during December. Plant them about three inches deep and afterwards mulch the beds with well rotted manure.

It is a good plan to put a handful of good sharp sand under all bulbs planted in the fall, for it lessens the chances of decay and allows the roots a better start. In the case of lily bulbs it is also a good plan to drop some sand on the top of the bulb; it is much better to fill the interstices between the scales with sand than to have them full of soil containing decaying vegetable matter.

Ranunculus have been improved so much of late years that they are among the best we can grow. The same is true of anemones and the treatment required in each case is the same. Both kinds should be soaked over night before planting to insure success, and plant them from one and a half to two inches deep.

Sparaxis and ixias are very popular, though the flowers are small and are very easily grown, being so persistent that they flower without care after appearing above ground. These should be planted about one inch below the surface.

Of all winter bulbs the narcissi are the writer's favorite, next to the lilies, and are only second to them in appearance. They are not so stiff and conventional as the hyacinths, are tougher, and have a longer period of bloom. They will do fairly well in any soil and will grow under almost any treatment, though responding nobly to proper care. No class of bulbs of late years have been brought to such a standard of excellence and the cost of all the best sorts is quite low; so if you once get a stock you will alwavs have them if proper care is taken.

POTATO HISTORY.

Perhaps no single article of human diet has a more interesting history than the Irish potato, or Solanum tuberosum. It belongs to a very numerous family, there being, according to good authority, 600 species of Solanum. Very few of them, however, form tubers, and still fewer are edible. According to Humbolt, this esculent tuber was cultivated from Chili to New Granada at the time Columbus discovered America. Nearly 100 years later some of the colonists sent out by Sir Walter Raleigh returned to England and Ireland from North Carolina and Virginia, taking with them some of these tubers. About the year 1586 they were cultivated on the estate of Sir Walter near Cork, Ireland. The new vegetable rapidly came into favor with the Irish peasantry; but, judging from the following, which is taken from the Encyclopedia Britannica, under "Ireland," it seems it was by no means an unmixed blessing:

"Toward the end of the 17th century Raleigh's fatal gift (the potato) had already become the food of the people. * * * The poor squatted where they could, receiving starvation wages and paying exhorbitant rents. Unable to rise, the wretched people multiplied on their potato plots with perfect recklessness. During the famine which began in the winter of 1739 one-fifth of the population is supposed to have perished. *. * *

"No political cause swelled the population as much as the potato. Introduced by Raleigh in 1610, the cultivation of this dangerous tuber developed with extraordinary rapidity. * * * The labor of one man could plant potatoes enough to feed forty. Early in Charles II's reign this demoralizing esculent was already the national food. Potatoes can not be kept very long, and there was no attempt to keep them at all. They were left in the ground and dug as required. A frost which penetrated deep caused the famine of 1739. * * * In 1845 the population had swelled to 8,295,061, the greater part of whom depended on the potato only. There was no margin, and when the 'precarious exotic' failed an awful famine was the result."

The ills of Ireland are laid to the door of Raleigh's Solanum tuberosum, on account of the ease of its production and its great prolificacy, thus causing a degree of indolence and increase on the part of the poorer classes, which were indeed appalling in their consequences. In this country the potato is one of our most important foods, but not our whole dependence, by any means, as it formerly was in Ireland.

GOOD LETTUCE.

There is hardly a vegetable that wears as well in people's favor as lettuce. T. Grenier says in Farm and Fireside that his family sometimes have it on the table once a day for weeks, and even months, right along, and we do not seem to tire of it. Of coure, we have it in prime order. "I do not want, and would not relish very much, the stuff that one finds so often on the market stands. I want it fresh and crisp, and then I only want the perfect, and preferably the inner, leaves, which are to be dressed with a little of the best olive oil that the market affords and with our own home-made clear cider vinegar. To my taste the garden affords no greater delicacy, especially when we have nice mealy potatoes and some good baked fowl or broiled steak to eat with it. In order to have first-class lettuce, however, we must in the first place have a good variety, and then give it the right treatment. Fortunately there is a long list of really fine lettuces, and it would be even a simple task to make a good selection if we would revise our long list of varieties and reject all mere synonyms. Just at this time I have the Black-Seeded Tennisball in perfection. This old English variety has been nearly fifty years in cultivation in the United States, and even at this time it is one of the four varieties most extensively grown, especially in the East. But it is offered in the catalogues of American seedmen under upward of forty different names. You may plant all of these and you will have nothing but a strain of old Tennisball, and in every case a good and reliable sort, perhaps as good as anything there is in existence Then if you plant it in early spring, in summer, or almost at any time, in very rich soil, where it has a continuous supply of moisture, you will most likely have good-sized heads that are as solid as a cabbage and as brittle as glass, and most delicious as a salad. The application of a little nitrate of soda broadcast to the plants set out in open ground in April has seemed to be of much assistance in making rapid and tender growth.

THE NEW ONION CULTURE.

Much has been said and written concerning the new onion culture, and amateurs often are made to think it some difficult process of growing onions. The new onion culture simply is the sowing of the seed under glass in a hotbed, and transplanting the plants into open ground. While I have had no experience in growing the crop on an extensive scale, yet on a small farm, where land that is in proper state for growing of that crop is limited, and where it is grown on a small scale, I find the new method renumerative. While the transplanting involves considerable labor, the saving of considerable hand weeding, the possibility of a perfect stand, the economy in the amount of seed, and the increase of the yield under this method recommend it to everyone growing the crop.

Experiments at the Ohio station gave the following results: Ten selected Prize-taker bulbs weighed eight pounds four ounces; the same number of bulbs not transplanted, four pounds four ounces. Pompeii, transplanted, seven pounds one ounce; Yellow Danvers, transplanted, five pounds; not transplanted, two pounds six ounces. Transplanting gave a decided increase with each of the fourteen varieties tried, amounting to 100 per cent in some cases.

At the Michigan Station transplanted Prize-taker gave a yield of 548 bushels per acre, while those not transplanted yielded only 216 bushels. Red Weathersfield onions at the Tennessee Station yielded 823 bushels when transplanted; not transplanted, 206 bushels.

These increases in yield ought to appeal to everyone who is interested in making his acres bring the most possible returns for both labor and seed.

FERTILIZING POTATOES.

Fresh stable manure, especially when harrowed in, tends to produce such diseases as scab, blight, and rot, and should, therefore, be applied, if possible, to the crop preceding, and enough used to provide for the needs of both crops.

The potato thrives best in a cool, moist soil, and, unlike the corn crop, roots quite deeply. It is therefore recommended that stable manure be plowed in for the above-mentioned reasons, and also to prevent the germination of the weed seeds contained in it, thus greatly reducing the cost of hand cultivation.

When a crop is to be grown on freshly broken sod, the best results will generally be obtained by plowing in a light application of stable manure, and using in the drill 8 to 10 cwt. per acre of a good high-grade fertilizer.

Chemical Fertilizers.

In large potato-producing sections, where the supply of stable manure is limited, many growers are obtaining splendid results from the exclusive use of chemical fertilizers, using about 1,500 pounds per acre. Where the physical condition of the soil is poor we should recommend plowing under a crop of clover, peas, or other legumes, and the application of 12 to 15 cwt. per acre of a high-grade fertilizer. In using either stable or chemical manures an excess should be avoided, as it tends to produce an overgrowth of vines, which invite and spread the attacks of the blight.

One hundred pounds of potatoes contain about 12.6 pounds nitrogen, 4.5 pounds phosphoric acid, and 30 pounds potash.

The knowledge of the analysis of the crop is of little value to the grower until he has studied his soil and learned its needs; but knowing both, he will be able to apply at the lowest cost the proper amount of plant food required to produce a full crop.

SOIL FOR POTATOES.

The ideal potato soil is deep, friable, retentive of moisture, and well drained. Heavy clay and very light sandy soils should be avoided. Stony land renders planting and cultivating difficult and expensive. The presence of decaying organic matter in the soil not only furnishes valuable plant food, but also increases the water-holding capacity. Everything else being equal, a northern slope would be preferred to a southern one, except when grown for early use, as the crop is sometimes badly injured by the intense heat increased by a southern exposure during a hot, dry season.

GOOD, big "mealy" potatoes can not be produced without a liberal amount of POTASH in the fertilizer—not less than ten per cent. It must be in the form of Sulphate of POTASH of highest quality.

"Plant Food" and "Truck Farming" are two practical books which tell of the successful growing of potatoes and the other garden truck—sent free to those who write us for them.

Compton, December 18-19.

Other institutes will be announced later.

CURRENT COMMENTS.

Demoralizing Condition.—The Cultivator has no time nor disposition to mix in the contention going on between the California Fruit Growers' Exchange and the Citrus Union. Charges of misconduct of the business, prejudiced to the interests of the citrus growers is made against the Exchange by the Union, which is passed back, of course, by the Exchange. One thing must be borne in mind. The members of the Exchange will not stand abuse by its agents nor its managers. High salaries must not be paid. Rebates must not be permitted—except they are shared in by the membership.

The time has come when the grower and not the officials of these citrus organizations, nor the agents thereof, must derive the benefits of a clean, honest, conservative method of doing business. As soon as it is apparent that the grower is not receiving his just deserts investigation should be instituted and officials changed.

As said above the Cultivator will not mix up in a "scrap" between competing organizations, but if it shall appear that the growers are being deceived, in any way, it will be the duty of this paper to ask some questions. And it will!

* * *

Agricultural .College .Again.—The State Fruit Growers' convention at Santa Rosa, last week, discussed freely and at length the question of the location of the State agricultural farm. As in some former conventions of different bodies, representing the agricultural interests of California, strong ground was taken against locating the farm at Berkeley, and after a spirited discussion the following resolution was adopted:

"Whereas, the State Legislature, at its last session, passed a bill appropriating $150,000 for the purchase and equipment of a State farm to be under the jurisdiction of the Board of Regents of the State University; and,

"Whereas, efforts are being made to locate the farm close to Berkeley, and make of it a laboratory venture; and,

"Whereas, such a plan is opposed to the intent of the framers of the bill and the wishes of the horticultural interests of the State; therefore, be it

"Resolved, that we declare it to be the sense of this convention that the farm should be located away from Berkeley and conducted in a manner that will enable the horticultural interests of the State to obtain practical benefits."

It is very evident the agricultural bodies of the State are a unit against locating the farm near the university, the argument being as heretofore stated by the Cultivator, that the farm does not want college professors to manage it, but practical farmers with liberal training and actual operation experience. In the face of such decided opposition the farm is not likely to be located at or near the seat of the State University.

* * *

Senator Mitchell Dead.—The ending of the life of Senator Mitchell of Oregon is pitiful indeed. After fifty years of active service to his state he lays down his life under most distressing conditions. Convicted of defrauding the government in public land conspiracy, with sentence of punishment hanging over him, he dies dishonored and unlamented by the state he has so long served.

His death was of comparatively sudden occurrence, resulting from hemorrhage caused by the extraction of teeth, as told in the dispatches. Death was hastened by Mr. Mitchell's weakened condition, due in part to the infirmities of age (he was past 70,) and in part to recent misfortunes and worries.

Having passed from the scene of his earthly activities silence best befits him now. The public he has wronged will soon forget his memory except to recall it and speak of it as best to be let alone.

* * *

Ownership of Railroads.—We hear the argument frequently advanced that it is a mistake to attack the railroads in their rate schedules because they are owned by the people and the growth of the country is measured by their development. Not long since a table of figures was given by the Railway Age, to prove the wide ownership of roads by the people, and following this appeared articles in various newspapers advancing the argument that in fact the roads of the country are in the ownership of tens of thousands of our common people and not strictly owned by groups of financiers, as has been supposed.

As may well be understood, in times of prosperity and easy money, investments are made by a vast number of individuals among all classes, ranging from small amounts to large holdings. But far exceeding these invested sums are the holdings of railroad stocks by the banks, big life insurance companies, trust organizations and kindred institutions.

* * *

The late investigations relative to life insurance companies have developed the fact that the great financial magnates of the country have their hands in the management of both the railroads and the insurance companies and are the arbiters of both. They absolutely control and direct the funds of each without regard to who may have holdings therein. The boards of directors are usually the same, and they proceed, so far as the individual stockholder is concerned, as if he were a minus quantity—which he is. Why, therefore, argue that it is best to let well enough alone, when the fact is apparent that the public has no voice in the administration of the railroads?

The line of reasoning is plausible, we grant, but not well taken. The premises are falsely laid down. There is no desire on the part of the public to injure the railroads of the country, and there ought not to be. They are as necessary to the development of the Nation as any other interest, and if the spirit of railway administration will rise to the needs of the times, grant equitable rates, purify itself of all secret abuses, the country will be satisfied and the earning power of the roads vastly increased, not diminished, as is now claimed.

Why?

Because a more equitable rate will insure added volume of business and consequent increase in toll tonnage. More than this, it will give a juster distribution of the net earnings of the roads to the common people—if the common people are really the owners, as we are asked to believe they are.

Senator Dolliver, of Iowa, answers the policy of this claim by saying: "The very fact, if it be true, that the public is so deeply interested in railway investments, strengthens the argument for administration reform, for if the people are, in actual fact, the real owners of the railway systems, as the figures purport to prove, then most assuredly are the people entitled to a full say in the matter of railway control."

The fact that the public is so strenuously demanding reform in this matter refutes the assumption that the people are generally investors in railroad stocks.

"It is all very well to marshal figures," says a writer in the Times, "to show that it is the general public and not the rings of railway magnates that really own the railways." But when the figures are examined the cold fact remains that it is the magnates who are in sole control, and, as recent disclosures have made manifest, are also, through nominees on boards of directors, in control of the investment companies that place the savings of the people at their command. The scattered individual investors, and still less the investors whose interest in the railways is indirect, as through the medium of an insurance company, have not the slightest share or part in the present system of railway administration.

So some other invention will have to be resorted to to show the country that it is to the general interest to let the present conditions governing rates and rebates alone, for if no better argument can be advanced than the one that the people are the owners of the railroads, and not the magnates, there will surely be a general overwhelming of railroad rates, for it is the people who are demanding the reform now, not the magnates.

* * *

The Senate of the U. S.—William E. Curtis the veteran newspaper correspondent in looking over the senate of the United States makes these observations on the membership of that body. He says:

"As one looks over the senate chamber from the reporters' gallery it does not seem to be filled with big men. Perhaps the present occupants of the floor are as good and as useful as their predecessors. Perhaps it is better for the country to have practical rather than brilliant senators. But the closest inspection cannot discover any such great men as Oliver P. Morton, Allen G. Thurman, Roscoe Conkling, James G. Blaine, John Sherman, George F. Edmunds, L. Q. C. Lamar, William M. Evarts and George F. Hoar. It is not necessary to go back to the time of Webster, Clay, Calhoun, Sumner, Breckenridge and Fessenden for purposes of comparison. I do not suppose there has ever been a more useful man in public life than the Hon. William Boyd Allison, who has served longer and done more hard work and accomplished more useful legislation than any other man who ever sat in the United States senate or any other legislative body in the world. He may not be as big as Alexander; he may not have made as much noise in the world as Julius Caesar or Constantine the Great, or so much trouble as Napoleon, but none of those men ever passed as many laws or appropriated so much money, or performed more solid, useful, everyday service for his country and mankind as "The Old Gray Owl" from Iowa."

The most important measure before congress is rate legislation and it has come to be practically a foregone conclusion. As the president states in his message he has no feeling of hostility to corporations and is not the advocate of any drastic regulation policy. He simply holds that certain abuses have been permitted which must be remedied, and that the basic principle of any proposed system of regulation must be that of justice to all parties concerned.

In due time the president will bring the Panama canal question to the attention of congress in a manner which it is safe to say will clearly demonstrate that he is in earnest about having that project pushed and gotten well under way before the close of his administration.

There will be no tariff legislation at the present session. Free trade between the United States and the Philippine islands may be established—something which The Capital has from the first contended that the logic of the situation demanded. But the schedules of the Dingley law will remain untouched. There is no demand for any changes and members of congress will be loth to assume responsibility for the commercial and industrial perturbation which would be sure to obtain in case a general tariff ripping crusade were inaugurated.

There will be much for congress to do, and it may be with propriety said that there is much which congress should not do—one of the hardest things for a legislative body to learn.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

The Placentia Orange Growers' Association will ship four carloads of oranges this week.—Fullerton News.

A carload of grapes from Santa Cruz County last week in Chicago for $2,080. That is good round price.

The product of the entire number of packing houses in Upland is now about ten cars of lemons and fifty cars of oranges per week.

Kingsbury, Tulare County, Recorder is authority for the statement that $75,000 worth of grapes were received at the packing house this season.

The Sierra Madre-Lamanda Citrus Association has shipped several carloads of early oranges East. The fruit is well colored and well sweetened.

Something between $40,000 and $50,000 was distributed among the raisin growers of Tulare last week. This will be the windup of the sale of layer raisins.

The apple crop at Oakglen and in that vicinity this season is surprising all previous records. The output will be more than 400 tons, according to word given by one of the largest growers there.

Secretary Willson, of the Santa Ana Chamber of Commerce, has shipped to Los Angeles a fine addition to the exhibits from this county, including a 180-pound pumpkin and some fine oranges and lemons. So says the Bulletin.

The shipments of citrus fruits from Orange depot of the Santa Fe for the week ending last evening, were twenty-two carloads. The total shipments from Orange for the year ending November 30th,—when the company's year closes,—were 707 carloads.—Orange News.

Many farmers who have uplands are preparing to plant vineyards next year, and the beginning of an industry that means a great deal to this community is well under way. We know of one man who intends to plant thirty acres and others are contemplating larger and smaller amounts.—Ukiah Times.

If all the apples shipped from Pajaro Valley this season were forwarded at one time they would make a solid train nearly seventeen miles in length, exclusive of the ninety-six big engines that it would require to haul this immense load of apples over an ordinary track. The string of engines would be about three-quarters of a mile in length.—Pajarian.

The Porterville Enterprise summarizes the orange and lemon shipments from Tulare County from October 28 to December 7 as follows: From Porterville, 392 cars of oranges, 12 cars of lemons; from Lindsay, 419 cars of oranges, one car of lemons; from Exter and Lemon Cove, 264 cars of oranges, 57 cars of lemons. Total, oranges 1,075 cars. lemons 68 cars.

J. H. Reed, says the Riverside Press, is in receipt of a letter from G. Harold Powell of the Department of Agriculture, who spent last winter here investigating the causes of citrus fruit decay. Mr. Powell writes that he will be here shortly before the holidays accompanied by two experts and take up again the work undertaken by him last year and which promises to be of such signal value to the citrus industry of California.

Orange picking at Orangevale has been goig on for a month, and some of the finest fruit ever grown in California has this season been shipped. Orangevale is one of the oldest orange-growing districts of Northern California, and with the planting to citrus fruits of communities of more recent growth has more than held its own. The trees of Orangevale are fine and healthy, and have attained a fine example of what other Northern California communities can do in citrus fruit culture.

Alden Anderson, Lieutenant-Governor of California and general manager of the California Fruit Distrubu-ers, the organization which ships and routes the bulk of the green fruit, has compiled some interesting figures about the season's shipments and has compared them with last year's business as follows, the figures representing carloads:

	1905.	1904
Cherries	79	209
Apricots	279	97
Peaches	1,946	559
Plums and prunes	1,391	1,053
Pears	1,013	2,186
Grapes	1,602	1,451
Apples	1,744	43
Quinces, persimmons, figs	17	28
Totals	8,071	5,626

All of this fruit is shipped in carloads of 24,000 pounds, with the exception of apples, which are loaded to the extent of 26,000 pounds per car. Expressed in another way, therefore, during the season just closed 197,192,000 pounds of green fruit were shipped East, as compared with 135,110,000 pounds for the season before, a gain of 62,082,000 pounds.

AGRICULTURE.

Turlock will ship 400 carloads of sweet potatoes this season.

The price of hay at Hollister has dropped two dollars a ton since last week's rain.

Visalia is to have a 350-ton beet factory ready for the crop of 1906. It will cost $400,000.

Three hundred and twelve carloads of potatoes were shipped from Stockton the first week in this month.

L. Smith of Santa Rosa sold, last week, half his hop crop for 11 cents per pound. There are 6,000 bales to ship yet.

Prof. E. J. Wickson says: Australian rye grass seed is usually sown at the rate of fifty pounds to the acre and it is not usual to sow it with alfalfa, as the latter seems to do better by itself.

The Holister Free Lance is criticizing the Spreckels factory for reducing the price of next season's beet crop. The price has been set at $4.50 per ton, which the Free Lance says will materially shorten the acreage promised.

They have a great county—that of Santa Cruz. Last year it produced cereal products, $978,013; fruits, vegetables, grapes and berries, $2,920,635; dairy products, $391,500; livestock, $310,010; poultry, $94,105; fish, $79,562; forest products, $947,469; manufactures, $2,086,603; wine, beer, etc., $131,292; miscellaneous, $108,729. Total, $7,195,918.

Lima beans are rising in price. One lot sold at Ventura recently at $4.10 per hundred. Most of the beans grown in the county have been sold and shipped, but there are yet a number of growers who are holding for $4.50, while some expect $5.

On account of their being infected with scales formed by a parasite dangerous to native fruit, State Horticultural Commissioner of Tacoma has ordered the local fruit inspectors to fumigate all Japanese oranges received at Puget Sound ports recently.

"The average yield of beets per acre last year, throughout the whole United States was 10.47 tons. It is fair to assume that a good farmer in a fair country will obtain at least 12 tons per acre, some will get as high as 20, or even 25, but we will say the average is 12 tons. Our sugar company at Visalia will pay $4.50 per ton for all beets delivered at the factory, then the farmer receives on an average of $54.50 per acre for his beets, less 25 cents per ton for freight, the company building and maintaining a loading and weighing station at the depot at their own expense.—Tulare Register.

LIVE STOCK.

The sheep owners of Solano County have determined to kill off the dogs that have been destroying their flocks. Many hundreds of dollars' worth of sheep, however, have already been killed by the dogs this fall.

The Downey Dispatch tells us that J. H. Stone of that place has shipped this year 5,275 cases of eggs, which would make 158,250 dozens, at a total cost of $47,475. The eggs averaged 30 cents a dozen for the entire lot.

The express shipments for last week from Escondido, the Times says, were 4,623 pounds poultry, 41 cases eggs. 410 pounds cream, and 365 pounds butter. It will be observed that the shipment of eggs is increasing in volume, and this will continue for several months, probably till May, when the climax is reached.

MISCELLANEOUS.

The Orosi Rochdale Company was incorporated last week, with thirty-four members.

The new cannery at Gilroy will employ from 500 to 600 hands. So says the Mountain View Register.

Work has begun on the erection of a glass factory at Monterey that will give employment to 300 hands.

Chino has received a section of the State circulating library from Sacramento, and it is now open to public use.—Champion.

The town Trustees have accepted the gift of the $10,000 donation from Andrew Carnegie for the building of a new library for Red Bluff.

There is a strong probability that large smelting works may be established at Chico for the reduction of iron ore.

The government dredger is pumping free coal from the bottom of the sea. The San Pedro people are carrying it away in baskets.

The Bakersfield and Ventura railroad engineers have completed one survey over the Cahuenga Pass into Hollywood.—San Fernando Press.

Hubert Howe Bancroft has sold his valuable reference library to the University of California. This library, consists of over 60,000 volumes.—Salinas Index.

The Santa Fe has ordered the abandonment of all its smoking cars and has ordered fifty-five new ones made of iron and steel for the better protection of life in case of accident.

The Palo Alto Board of Trade has prepared a tree planting ordinance to be presented to the town Trustees, to the end that a systematic plan of beautifying the town might be followed.

A snail farm is to be started near Stockton. The demand for snail soup is quite general in the cafes of San Francisco, and the proprietors of this industry expect to make a neat income out of their undertaking.

The Superior Court of Orange County has confirmed the sale of 14,000 acres belonging to the estate of the late Marcus A. Foster. The purchaser is William Graves of New York. The consideration is $198,000.

William J. Browning of Tipton, Tulare County, who owns the most unique farm in the world, a jackrabbit farm, says the Bakersfield Echo. Mr. Browning has a 1,400-acre ranch near Tipton, where he raises rabbits for coursing parks all over the country. He has now 2,800 rabbits.

Shipments of salmon eggs from the Battle Creek Fishery at Anderson are being made daily to Sisson. From 500,000 to 1,000,000 are sent at one time. There is a good run of salmon this year, and up to Sunday of last week 20,000,000 eggs had been taken, averaging about 1,500,000 daily.

The recent fall of snow in the Sierras has caused the shutting down of the sawmills in El Dorado County. The sawmills were operated longer than usual this fall on account of there being no heavy storms until late. The amount of lumber cut by the sawmills this year in El Dorado County is about 60,000,000 feet.

An appropriation of $11,000,000 was voted by Congress on Saturday toward the construction of the Panama Canal. The amount was a compromise between the $16,500,000 carried in the bill under consideration, and an estimate of something over $6,000,000 recommended by Mr. Williams, to carry on the work until the middle of January.

C. H. SESSIONS, ASSOCIATE EDITOR

IN THE DAIRY.

One of the most progressive states in the Union, on general agriculture, is Kansas. It is a state of diversified industries but it keeps abreast of the times on every subject relating to stock, dairy and farming.

The Cultivator is under obligations, this week, to Editor E. B. Cowgill of the Kansas Farmer for an article, with illustrations, on the method of obtaining the most milk and best results from manipulations of the udder in milking. We commend the careful reading of the article to all dairymen and especially to beginners. The article is as follows:

The fixedness of the amount of fat in a cow's milk makes it necessary to watch the breeding, for by a change of blood we can lower or raise it in one generation very markedly. The slight increase in butter-fat, the second year that a cow is in milking, often deceives people into thinking that this is not true, but this rise is due to the superior care and feeding a cow receives in enabling her to reach her limit, for the concentrated food gives her all she can assimilate of milk-producing food. In the Holstein the change of form is often marked, the heifers sometimes are so coarse and beefy that one is a little ashamed of them, but when they have had their second calves they come to the milk form rapidly and make good cows. Several that were of this type are now in the Advanced Registry with creditable official records.

The milking of cows is of as much importance as the feeding. Where one has a large herd, a prize of a dollar a week to the milkers whose cows do the best, when the milk is on the increase, or whose cows fall off the least, when the milk is decreasing, gives good results. One of our neighbors thought he would try this plan. He also ran a hotel in town, which the home farm supplied with milk. At length, the cook remonstrated with him, as the milk was growing thinner every day. There was no foreman over the milkers, and they found the pump very handy to increase the milk-yield.

There is a serious loss in allowing the cows to go dry too soon, and to remain dry for several months. Six weeks is long enough for a cow to be out of milking, and heifers must be milked up to this time if they only

Fig. 1.—Correct Milking.

give a quart a day, or else each time they freshen they will go dry at the same period. We never believe in forceful drying off of cows, by giving them alum internally, or by starving them, or by rubbing camphor on the udder; any of these ways of stopping the secretion of milk should be looked on with suspicion. Nature knows best and it is safer to follow her indications. We feed the cows right along; if they go dry before calving, we allow them to do so, but without any drop below a gallon of milk at a milking, they are milked regularly without any attempt to dry them off. The idea that milking the cow stunts the calf does not hold good if the cow is fed. Of course, if the cow is starved she will drop a feeble calf. This is not theory, but learned by hard experience and the spoiling of a few cows. Some extra good cows that we sold fell into the hands of a theorist and he forcibly dried off some of them, so that they have not recovered their full milk flow. One cow that at full flow of milk gave 75 lbs. has only a record of 50. She has made three pounds of butter a day; now her highest record is only a little over two pounds. Forcible drying off will ruin many Durhams, Ayrshire and Holstein cows, or any cows that are giving a large volume of milk.

The older dairymen were wise in insisting on stripping the cows. We have had to come to it, as a practical necessity for it is easier to have one good head milker who by stripping the cows can keep the other men milking clean, for where the stripper comes along any slackness is at once discovered.

The time spent in stripping is fully paid for by the extra fat obtained. As the cows are usually left by the ordinary milker, each cow will strip from three-quarters to a pound of

Fig. 2.—Stripping.

milk. This milk averages 7.5 per cent of fat, so that on a string of thirty cows, there is 15 to 30 pounds of 7.5 per cent milk; this equals a daily loss of 2 to 2¼ pounds of butter-fat, worth say twenty cents a pound, or 40 to 45 cents.

The Hegelund method of increasing the milk flow has been tried by the Cornell and Wisconsin Stations, and bulletins issued telling the results and making comparisons with the ordinary forms of strippings. The Hegelund method is a series of manipulations, or a massage of the udder that can best be studied from the illustrations. These manipulations follow the regular milking. They are described as follows:

Fig. 3.—First Manipulation, Right Quarters.

First Manipulation.—The right quarters of the udder are pressed against

Fig. 4.—First Manipulation, Left Quarters.

each other (if the udder is very large, only one quarter at a time is taken) with the left hand on the hind quarter and the right hand in front on the fore quarter, the thumbs being placed on the outside of the udder and the four fingers in the division between the two halves of the udder. The hands are now pressed toward each other and at the same time lifted toward the body of the cow. This pressing and lifting is repeated three times, the milk collected in the milk cistern is then milked out, and the manipulation repeated until no more milk is obtained in this way, when the left quarters are treated in the same manner. (See figs. 3 and 4.)

Fig. 5.—Second Manipulation Right Fore Quarter.

Second Manipulation.—The glands are pressed together from the side. The fore quarters are milked each by itself by placing one hand, with fingers spread, on the outside of the quarter and the other hand in the division between the right and left fore quarters; the hands are pressed against each other and the teat then milked. When no more milk is obtained by this manipulation, the hind quarters are milked by placing a hand on the outside of each quarter, likewise with fingers spread and turned upward, but with the thumb just in front of the hind quarter. The hands are lifted and grasp into the gland from behind and from the side, after which they are lowered to draw the

Fig. 6.—Second Manipulation, Hind Quarter.

milk. The manipulation is repeated until no more milk is obtained. (See Figs. 5 and 6.)

Third Manipulation.—The fore teats with partly closed hands and lifted with a push toward the body of the cow, both at the same time, by which method the glands are pressed between the hands and the body; the

THIS SKIMMING MACHINE takes the cream from the milk quicker than wringers squeeze water from clothes. It gets **a quarter to a half more cream** than by setting, because it uses centrifugal force—a force thousands of times stronger, quicker, more effective than the force that makes cream rise in pans.

Sharples TUBULAR CREAM SEPARATORS

Skimming finished five minutes **after** milking, because boy of ten can run Tubular **during** milking. No skim milk to warm, because skim milk is fed still warm from cow. **Half less washing, labor and expense,** because only cream is put away. Catalog X 260 explains clearly.

milk is drawn after each three pushes. When the fore teats are emptied, the hind teats are milked in the same manner. (See Fig. 7.)

The average increase of milk was one pound a day per cow; the average of the fat of the entire milk was 4.29 and this last pound of milk obtained had 10.32 per cent. of butter-fat.

JERSEYS AND GUERNSEY.

The ten thousand or more farmers and dairymen in California, who come from Iowa, know personally, or by his writings, Prof. W. J. Kennedy of the Iowa Agricultural College. He has just returned from a year in the old country where he went to study animal industry and its kindred subjects. He makes the following notes of how dairy cows are cared for on the Channel Islands. One thing appeals to us of instinct, and that is, that dairying is carried on successfully on high-priced land. Prof. Kennedy says:

"That dairy farming can be conducted on very valuable land is amply illustrated on the island of Jersey. With land for agricultural purposes renting for from $40 to $80 per acre the people of this little island have been compelled to adopt a very intensified system of farming. The farms are small and the most important crop is early potatoes, which are grown for export."

Feeding Dairy Cows.

The Jersey cow in her native land is not so liberally fed as in other countries. In some instances the cows are wintered on the grass lot with some straw and few roots in addition only, but generally they receive better care. Roughage is fed in limited quantities, and a great deal of dependence is placed on the root crops to furnish the bulk of the winter rations. This is a cheap source of feed because they are grown as a second crop on the potato land. Turnips, swedes, carrots and mangels are all grown. On some farms cabbages are grown for winter feeding. They are not so likely to impart an undesirable flavor to the milk as turnips, and are growing in public favor. Grain and cake are fed in very small quantities. The majority of farmers use from 2 to 5 pounds per cow per day, and it is said that only one farmer on the island feeds as much as 10 pounds to cows in full milk. During the summer no grain is fed as a rule. Great care is given cows at calving time; warm bran mashes are usually fed at this time. Bran mashes are frequently fed throughout the entire period of lactation, and on all farms the cows are grazed from four to seven hours each day throughout the winter. The freedom of the cattle from tuberculosis is emphatic evidence of the wisdom of this method of management.

* * *

Guernsey.

Although the island of Guernsey is located quite near the island of Jersey the conditions prevailing are quite different in many respects. Land rents are not so high in Guernsey, but from the standpoint of live-stock production this has not proved to be an advantage. The live stock interests are confined almost solely to the Guernsey breed of cattle and are of secondary importance from an agricultural standpoint. The production of tomatoes, grapes, and bulbs, under glass, occupies the first attention of the people, and live stock are maintained largely because of their favorable influence on the fertility of the land. Like the farmers of Jersey, the breeders of Guernsey do not give their cattle as good care and feed as those in countries where the production of dairy and meat products is more important. However, the methods of feeding are very good on many farms. A system of feeding which has a slight tendency to produce flesh is appreciated rather than otherwise. With this exception, however, the methods of feeding are very much the same as in the island of Jersey.

Grass, soiling crops, and roots supply the succulent feed. Mangels, turnips and carrots are the common roots, but parsnips are also fed and are particularly valuable as they do not taint the milk. The amount of roughage used is larger than in Jersey.

GOAT DAIRY IN CALIFORNIA.

A correspondent writes the Cultivator of an interesting experiment in goat dairying being made near Los Gatos, by Dr. Johnson. He has about eighteen milking goats, some of which cost him over $100.

The animals produce milk on much less feed than the cow and it is of a richer quality. We understand that the experiment is proving successful and that soon the herd will be increased. The demand for goats' milk is growing, especially for children, and we expect to see the day when it will be used quite generally. In the countries of the old world, goat milking is very common. There the owners of the goats drive them to the customer's door and milk them. Until recent years, however, few goats have been milked in this country, but within the past few years their numbers have been steadily increasng.

THE URGENT DEMAND FOR BETTER MILK.

Consumers are getting more particular and there is an increasing demand for better milk. They want milk that is not only pure and unadulterated, but free from dirt, the product of healthy cows kept in hygienic stables and fed upon healthful food, and milk that is entirely free from the germs of tuberculosis or other diseases. Now the consumer can get milk that complies with all these requirements, if he is willing to pay for it. Fancy dairies in different parts of the country are already supplying just such milk and receive for it from 8 to 15 cents a quart. But the great mass of consumers are unwilling to pay fancy prices for milk. For generations they have been taught that 5 or 6 cents a quart at retail is all that milk is worth, and they feel robbed if they are obliged to pay more. They have persistently underrated the food value of milk. The housewife will pay 20 to 30 cents a pound for sirloin steak without a qualm, but "goes up in the air" if called upon to pay 7 or 8 cents a quart for milk. And yet milk will furnish more digestible nutrients in a form available and agreeable to the average individual than will the same amount of money's worth of steak.

Another mistake on the part of many consumers is the carelessness with which milk is treated after it is delivered to them. The magazine, Good Housekeeping, cites instances where milk, bottled and sterilized, has been spoiled in the houses of wealthy and intelligent people, by having the cover removed and the open bottle of milk stored in the refrigerator with onions and other ill smelling substances. Of course it was the careless cook's fault, but the producer got the blame. The great trouble with the country end of the business for years has been that the farmer is obliged to keep down the expense of production to the very lowest notch or go out of business. We are not apologizing for unsanitary stables and improper handling of milk, conditions that should be reformed wherever they exist, but consumers must not expect a 10-cent article for a nickel.—Orange Judd Farmer.

* * *

No, consumers should not expect "a 10-cent article for a nickel," but they have a right to expect that the nickel's worth shall be pure and wholesome. We realize, of course, that there are too many housewives who neglect the care of the milk after it is delivered. They let it stand in a warm place or in the sun, until all the germs in Christendom have generated, provided the milk is in an open vessel. But this will not excuse the dairyman in neglecting the rules of cleanliness in his stable, or his cows, nor excuse him if he overlooks proper feeding. It is this neglect which is telling on the health of our children today, a fatal mistake of the common dairyman.

ANGORA GOATS.

Editor Cultivator: Where can I get Angora goats, and price usually asked for the male and female? W. H. S., Santa Barbara.

C. B. Bailey & Son, San Jose, do not know what price is asked. You can write referring to The Cultivator as your source of information.

The W. C. T. U. has presented the town of Oxnard with a new drinking fountain.

MRS. A. BASLEY, ASSOCIATE EDITOR, HOLLYWOOD, CAL.

WHICH IS THE BEST MOTHER?

"I have just bought an incubator," said a friend last week. "I want to make some money out of chickens. I wish you could give me some hints on how to succeed."

It would take very broad hints or more than hints to help some good folks to success in the poultry business, but a few hints on how to care for young chicks, either motherless little ones brought up in a brooder or those being cared for (?) by their own mother.

With well hatched chickens there should be but little trouble in raising 90 per cent. or more to marketable age, yet there are many who are satisfied if they raise 50 per cent. of those that hatch. I have seen it stated that out of one hundred fertile eggs in the incubator, not forty chickens reach the market, 60 per cent. of the embryo deaths being due to the ignorant application of hygienic laws.

It is humiliating that with all our boasted science and our world-renowned ingenuity, the Egyptian fellah and the heathen Chinese should excel us in both hatching and rearing chicks but such is the fact. In view of these facts let us consider a little why there is any mortality among brooder chicks and which is the best mother, an old hen or a modern brooder.

* * *

As I have said before, the last week of the chick's life in the egg has much to do with the chicken's vigor, the eggs must be kept at the proper temperature and moisture, and be properly aired, otherwise the yolk will not be assimilated and when drawn up into the bowel cavity during the last day it will remain there undigested if the bowels are weakened by overheating.

As an illustration of this, I had a friend with a little boy visiting me one spring. One of my incubators had 241 fertile eggs due to hatch in four days. The little boy closed the damper when I was absent for two hours, and the quicksilver ran up to the top of the thermometer, about 120 degrees. I quickly cooled the eggs off and sorrowfully returned them to the incubator. When hatching time came I found a number of chicks were cooked in the shell, but a hundred and seventeen hatched out and my hopes were raised. I tended them carefully (they were such beauties!) I put them into three brooders warmed just right, but every day there were deaths to chronicle, till every one was dead. I doctored them, fed everything I could think of, but the yolk, like a tough bit of rubber in some, or like a hard-boiled egg in others, remained inside them. I supose it was either cooked or the bowels were so weakened by the over-heating that they could not digest it. In any case the chicks died of blood poisoning.

The same may result from feeding chicks too soon. The chicks should be left in the incubator twenty-four hours after hatching, and when moved into the brooder should not be fed for still another twenty-four hours,. In this we are copying nature and following the example of the old hen. This was explained to me years ago by a very clever surgeon who had successfully operated on chicks by cutting them open and removing the yolk. If the chick eats before the yolk is assimilated or digested, whichever you like to call it, the gastric juice or the nervous energy which ought to be working on the yolk, is drawn away from it, and is taken into the crop and the proventriculus and gizzard to digest the new food which has been administered. Sometimes there is enough of this fluid to go around and do all the work if the chick is very vigorous, but it more frequently happens that there is not enough, in which case the digestion of the yolk (which is a perfect nourishment if only digested), turns putrid and kills the chick. Or should the digestion slowly progress (taking ten days instead of three days), it may bring on bowel trouble which at so early an age, will stunt the growth if it does not kill the chick. I am particular in explaining this because sad disappointments and post mortem examinations have given me experience in this matter and I want our readers to benefit by it.

To raise chicks successfully, three things are essential; first comfort, second proper food and water, and third, exercise. Of these comfort is chief.

* * *

Under the head of comfort comes the proper kind of brooder and plenty of room. The veteran poultry breeder, A. F. Hunter, says: "With incubator chicks raised in brooders, elbow room seems to be a most important factor, and want of elbow room is one cause of the great mortality in brooder chicks." It is quite natural to suppose that a brooder which is three feet square is plenty large enough for seventy-five or a hundred chicks, and so it is for chicks as they come out of an incubator, and if we do not want our chicks to grow it might be all right to crowd them, but chicks well hatched will grow quickly and in a very short time will be twice the size they were when hatched and will require twice as much room or suffer for it.

(To be Continued.)

* * *

EDITOR'S QUESTION BOX.

What to Feed an Old Rooster.—Some time ago I read in some paper what to feed old roosters for a week and it would make him tender and juicy. I thought nothing of it then, but now I have the rooster and want to try it. Will you kindly publish that or some other recipe for that purpose in the columns of the Cultivator?—Mrs. W. L. B., Campbell, Cal.

Answer.—Does this conundrum come lawfully into the poultry editor's question box?

As it is Christmas time she will be good- natured and attempt it. When the rooster is well plucked, singe him. Then cut off his neck (save it) close to the body, but slip the skin back so as to have a large piece left on the body to keep the dressing in. Cut a straight slit at the vent, remove all

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the GOLD MEDAL at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.

And Now Comes New Reward for Merit:

Read the following telegram received from the Lewis & Clark Exposition at Portland:

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

San Francisco Office and Salesroom, 33 Market St.

the entrails, fill the cavity and the breast with the following dressing: One-fourth of a loaf of bread, if stale soak five minutes in cold water (not hot water), squeeze dry and crumble; add half a cup of beef suet chopped fine, a small onion chopped, a little celery and parsley, half a teaspoon of salt, pepper and sage. Stuff this into the rooster, sew up the holes in the skin, tie the legs firmly and pass the string, crossing it on the back, round the pinions and tie; then either steam him for two hours or stew him very slowly for that time in water in which is dissolved half a teaspoon of bicarbonate of soda. Then put him into the oven, sprinkling with pepper and salt, and bake for an hour. He will be almost as good as turkey. Save the liquor in which he was stewed; thicken with flour for good gravy.

WHAT TO FEED THE HENS AND CHICKS.

The question of the best food for laying hens and growing chicks is always an open one. I have given the matter careful attention, and have at last devised a menu for biddy and her offspring which I do not believe can be improved upon as a regulation diet. I may say at the beginning that in my opinion the secret of raising chickens lies in dry feed. Anything else is pretty sure to cause more or less bowel trouble and consequent loss.

My first feed for newly-hatched chicks is oatmeal—not the prepared foods, but the plain meal. I keep on with this for a week, supplying sand for grit, and keeping plenty of fresh water or skim milk before the chicks. I then feed cornmeal and bran, made into a cake with soda in the usual way. The cake is crumbled into bits, and is eaten greedily. For the second week I feed this a part of the time, and a part of the time oatmeal. I leave mashes severely alone. They ought to have no place on a chick's diet list. The old practice of bringing up chickens on cornmeal mash is out of date. Not only is the mash in itself a bad thing, but cornmeal is not a growth making food. It produces fat rather than bone and muscle. Bran is the better by far; wheat bran affords quick, steady growth, and buckwheat bran is also good. The third week one may begin feeding wheat. Stick to wheat if raising laying stock; if raising broilers, alternate with cracked corn until old enough to fatten. Until a month old, give one feed a day of the corn and bran cake. After that, occasionally vary the wheat diet with cracked corn, buckwheat, etc.

Skim milk is of great value in making growth. If skim milk cannot be had, and the chickens are confined, meat scraps or meat meal ought to be be fed. The meat meal may be baked with the corn cake.

My hens lay winter and summer. My summer menu is as follows: Morning, cracked corn (I would feed wheat, but cannot get it at present). Noon, dry bran in a trough. Night, table scraps, mixed with bran so as not to be wet.

The table scraps include bits of meat, vegetables, bread, pastry, banana peelings, etc. The tops of the vegetables, potato parings, apple peelings, etc., go into the hen's dish. These are chopped fine and thoroughly mixed with the bran. Lawn clippings are occasionally thrown into the pens, and skim milk given to drink. Skim milk is excellent for laying hens, and with me takes the place of meat. It is of fully as much value in egg-making as whole milk, for cream is practically nothing but fat. In winter I recommend these rations: Morning, whole corn, warmed or parched and thrown in the litter; noon, dry bran; evening, mash, composed of meat scraps, vegetables, bran and a little corn meal. If skim milk is given the meat may be omitted, although best results come from using it.

The mash should be mixed very dry. Many of the ailments of laying hens are caused by bowel trouble, of which soft feed is a prolific source. Vegetables chopped fine or, even better, mashed into a pulp, are of much value, and constitute a chief ration. A cabbage hung in the hen house just high enough to make the hens jump for it, furnished fresh green food in a very satisfactory manner. The dry bran at noon will not be eaten greedily, but the hens will eat on it a little at a time during the afternoon. They cannot stuff themselves with it. No more should be given than will be cleaned up in three or four hours. Of course plenty of grit and oyster shells should be provided, and good results will come from furnishing warm water.

The system I have outlined may not force the hens heavily, but I believe it to be one of the most practicable for obtaining the maximum number of eggs and raising the maximum number of chickens at the minimum of expense.—E. I. Farrington, in Country Gentleman.

SHOW YOUR BIRDS.

The season of poultry exhibitions is now on. It will run for several weeks, and be productive of much pleasure to those who own fine birds. The Cultivator desires to urge upon owners of fine birds to exhibit them at their poultry shows. We believe with Henry Wyatte, writing in the Inland Poultry Journal, that the annual poultry shows are the life of the poultry business in America.

Those who have, in by-gone days, taken their birds to the shows have been benefitted according to the purpose they had in mind in going. Some persons go for the prizes and money they get out of it; they find out how strong the class will be in which they intend to show, and, if there be little or no competition they show birds that are, in their minds, on the safe side of winning; take the honor and money as well. Then they advertise—a good thing to do, if they are thoroughly honest about it—give the impression that they have done great things in winning at said shows; perhaps adding, "in strong competition," when they left their own "weak" birds at home, and brought "stronger" ones to show, so as to sell their own raising—weak ones—on the strength of such prizes won. Some one buys this man's stock, or eggs, at a fancy price, thinking he is either getting birds that are prize winners, or some of the same stock, or eggs from such. Thus, in cases of this kind, and I am sorry to say there are far too many of them, the buyer is defrauded. He buys and pays for what he does not get. A worse "take in" than even this, is that his hopes will be dashed to the ground and he will meet with a whole year's disappointment as well. To publish the winnings of such breeders in our show records is not only morally wrong in itself, but a menace to the poultry fraternity as well. May the number of such exhibitors never increase.

Others go to some exhibitions in order to put their stocks in competition with those of other breeders; have some reputable and reliable judge pronounce upon them, and after the prizes have been awarded compare their birds with the others; if scored see where their birds have been cut and why; study how they can improve their stock in that particular, and, if possible, buy the bird or birds that will accomplish the results. If necessary, such a breeder is willing to pay big prices for them, too. These breeders will be benefitted in one point at least. Another good point of attending the shows is that of meeting with and conversing with breeders of great reputation; breeders who have been known to them in name only before, if they take the poultry journals. There are men who may be able, in a few minutes talk, to help you more, without giving away any secrets in poultryism—than reading articles in our best poultry journals. Such fanciers are generally satisfied if they come out on the whole, generally speaking, with making expenses in attending the show. If they have won good honors, they of course, advertise, and do so, as strong as their stock warrants it and no further.

No amateur can get along and breed good birds without taking them to the shows, at least those that are nearest and "dearest" to him. He

Sending a Train Load of Coulson's Poultry Foods Down in Central California, San Joaquin Valley

Scene at Petaluma Freight Depot—Sending a train load of 12 full cars loaded with Coulson's Egg Food and Coulson's Special Chick Feed down into Central California.

A. R. Coulson, president and manager of the Coulson Poultry & Stock Food Co., has this year traveled all over the state of California in the company's automobile. The following is a clipping from the Petaluma Argus:

"MADE AN AUTOMOBILE TRIP TO MEXICO.

"A. R. Coulson returned Sunday afternoon from San Francisco. He arrived in the metropolis from Mexico, after an absence of ten weeks. He reports a fine trip. During his long trip he did not have an accident with the automobile. Mr. Coulson is the first person who has driven from San Francisco to Mexico in an auto, the distance being about 2000 miles. The auto will arrive tonight from San Francisco."

About April 10th, Mr. Coulson accompanied by one of the salesmen, started on their long automobile trip. On their trip down along the coast, from San Francisco to San Diego, they took orders for over 500 tons of Coulson's Egg and Chick Feeds, about 35 carloads. Afterward, in the month of July, another 100 tons was sold in Humboldt County, and on their trip through Napa and Solano counties, another 100 tons was sold. In September, on their trip from Sacramento to Redding, up the Northern Sacramento valley, seven more carloads, and on the last trip in October, Mr. Coulson, accompanied by Mr. J. M. Bull, sold twelve carloads more in the San Joaquin Valley, as follows:

Simon Newman Co., at Newman, 1 car; Dos Palos Colony, Rochdale, Assn., 1 car; Moore Plate Co., Madera, 1 car; Fresno Rochdale Co., 2 cars; Kutner, Goldstein Co., Selma, 1 car; Kutner, Goldstein Co., Hanford, 1 car; Linder Hardware Co., Tulare, 1 car; H. Frame and the Rochdale Co., at Porterville, 1 carload; Goldstein & Iseman, Visalia, 1 car; Burum & Burum, Dinuba, 1 car, not less than 15 tons in a car.

Each of the 70 firms that handle Coulson's Foods in carload lots, wholesale it to a number of other stores, so that there are probably 600 or 700 stores on the coast that sell Coulson's Egg Food and Coulson's Chick Feed, so that you should be able to get Coulson's poultry foods at some store in every town.

Mr. Coulson visited nearly every poultry raiser or farmer that raises poultry, having talked with over 5000 of them this summer, and it was always noticeable, that where the poultry was fed on Coulson's Foods, the fowls had such bright red combs (showing healthy liver). Their plumage was even and glossy, they were spry, active and healthy, and the owners were satisfied that feeding Coulson's Balanced Rations was far better than ordinary grain feeds.

Mr. Coulson believes in small profits and large sales. He also believes that the best of everything is the cheapest in the end. Consequently, only the best grade of feed and ingredients is used in preparing Coulson's Feeds.

There are many firms that imitate Coulson's Poultry Foods, and which they offer at a cheaper price, but they do not contain as many of the expensive and result-getting articles. In spite of all the cheaper imitation foods offered, there is undoubtedly more of the Coulson's Food sold, than all others combined.

You will never know how good COULSON'S POULTRY FOODS are until you see some of the imitations.

A. R. COULSON,

President and General Manager of Coulson Poultry & Stock Food Co., now incorporated at $100,000, and soon to be increased to $150,000.

So when you buy a chicken ranch, the first thing you want to do, is to find out where you can buy COULSON'S FOODS, for chickens are like machines, and if you treat them right, and feed them on COULSON'S FOODS, they will make money for you.

THE COULSON COMPANY'S AUTOMOBILE.

With which Mr. Coulson this year traveled all over the state of California on business.

One poultryman at Hanford has a flock of 350 hens, and for over a year they have been fed on COULSON'S EGG FOOD. At present, these hens are laying two cases of eggs per week, which are sold at Berkeley for 50c per dozen. The cost of feeding these hens Coulson's Egg Food is less than $4.00 per week. Amount received for eggs, $30.00 per week.

Another large poultryman near Petaluma has 3200 laying hens, which have been fed on COULSON'S EGG FOOD for the past three years. They are fed two sacks of Coulson's feed a day, and they are laying now 1200 eggs a day, which means 600 eggs from one sack of Coulson's Egg Food, or $20.00 worth of eggs from less than $2.00 worth of feed. You could afford to feed your hens Coulson's Egg Food and make a profit even if it cost twice as much as it does.

READER, YOU SHOULD FEED YOUR HENS COULSON'S EGG FOOD EVERY DAY.

They need it in their business.

Coulson's Egg Food is a rich feed, composed of about three-fourths ground grains or mill feeds, and one-fourth of extras, like Dried Blood, Cooked Meat, Fresh Ground Bone Meal, and other things, all thoroughly mixed, ready to feed the chickens and make them lay.

Ask your dealer about it.

COULSON'S EGG FOOD For Hen.

COULSON'S SPECIAL DRY CHICK FEED for little chicks.

Manufactured by

Coulson Poultry & Stock Food Co.

Petaluma, California

Nothing Succeeds Like Success

325 carloads of Coulson's Poultry Foods (Coulson's Egg Food and Chick Feeds) sold in California during the year 1905. Enough to make a solid train load two and one-half miles long requiring 20 engines to pull it. Over 125 carloads shipped by steamer.

BALANCED FEED RATIONS

Intelligent feeding of Poultry and Stock is the one way to make it pay. You have heard that some foods furnish fats, other foods make muscle and tissue, and others make bone, shell, etc. You know that most foods contain one or more of these elements, but no feed would contain them all in the proper proportions.

Now, by understanding the different values of different feeds, is where the secret of success comes in. The Coulson Poultry & Stock Food Co. makes a specialty of the feeding problem. Under the care and instructions of A. R. COULSON, the Chicken Doctor, they prepare special mixed feeds, or properly "balanced" rations for poultry, which are mixed with the right ingredients, in the right proportions to make poultry pay.

First, they make a Special Chick Feed for feeding baby chicks. It is composed of tiny pieces of cracked grains, specially selected small seeds, baked hearts in meal, pin-head size, Steel Cut Oat Meal, Millet Seed, and other things, each in the right proportion to keep the little chicks healthy and make them grow.

The COULSON POULTRY & STOCK FOOD CO., occupying a building 70 by 120 feet, and also several smaller buildings on the property at 730-736 Main street, Petaluma, employing about thirty hands, are engaged in the mixing of the various feed stuffs, animal meals, beef scraps, dried blood, ground bone, seeds, etc., into the best properly balanced mixed feeds, especially adapted for certain results.

The materials are brought in large quantities from all parts of the world. Mill Feeds from Washington and Oregon and various parts of California, Oat Meal in carload lots from Illinois and Kansas, Millet Seed in carload lots from Minnesota, some from Germany, Hemp from Germany, Canary Bird Seed, some imported, Peppers from Japan, Rice from China and Japan, Flaxseed from Oregon, Ginger from Africa and Japan, Corn from Nebraska, etc.

$100,000

PAID TO THE ARMOUR PACKING CO.

For our Animal Meals, which includes Dried Blood Meal, Meat Meals, Beef Scraps, etc., which enter into our Poultry Foods and other balanced rations, we have an annual contract with the Armour Co., with their vast works at Chicago, Kansas City, and South Omaha, employing in all, an army of 25,000 people. By this contract we have the exclusive sale for the Pacific Coast of their goods in our line.

This Meat Meal is made from **Hearts** and **Livers**, which are kept separate from all the rest, for our own trade. After being thoroughly cooked, they are dried, then ground and screened into different sizes and sacked, and shipped to us in carloads of 20 to 50 tons.

The Bone Meal, Animal Charcoal, etc., (made from fresh ground bones only), are prepared for us at San Francisco, by the largest concern of the kind on the coast, giving us the benefit of the latest improvements in machinery and methods of preparations. In the process of manufacture of Bone Charcoal Bone Meal, etc, great care is exercised that none are lost.

All these ingredients are mixed together in proper proportions, all ready to feed to the chickens.

If you are interested in poultry, send us 4 cents to pay postage on our 80-page Catalogue and Poultry Account Book free.

will learn more in this way than he possibly could by a considerable amount of study at home. Some things can be learned in no other way. It all takes time, patience and careful attention to small details in order to be successful, and a little money may help, too, some. Still the saying, "finis coronat opus" (the end crowns the work) is an encouragement to many a one when difficulties meet them.

Another reason for showing stock honestly might be mentioned; unless a man is willing that his birds should come into competition with others, he has no right to charge a fancy price for his stock and eggs. But of course some claim there is a single exception to this, where a fancier has his record and name established and wishes to keep out of the show business for the sake of his customers, who buy his stock and eggs; but I doubt it. Some fanciers may think they are giving their customers their money's worth, and still at the same time be defrauding them, simply because they overlooked some little point. By all means show your birds, show them honestly, and then advertise them in The Cultivator that others may know where to buy what they want.

ALAMEDA COUNTY POULTRY SHOW.

The Alameda boys are proud of their show this year. It came off on the date set a year before, a larger number of birds than the year before, and it was a complete success. All awards were made and ribbons up before the show opened. About 700 or 800 fowls were exhibited—no pigeons—and all joined in the claim that the quality of exhibits was above the average.

The new coops and the vigilance of Superintendent Healey in keeping the litter out of sight gave an added pleasure to that of looking at fine birds. Secretary Tracy informed us that the financial returns were ample to cover all expense and that the association is in flourishing condition. Probably the happiest exhibitor was Mrs. L. B. Rhodes of Milton, who won for the second time, the cup for the ten highest scoring birds. Another winning and the cup is hers.

President Gregory told me that the date for next year's show is practically set and plans for a "better than ever" will soon be put agoing.

The regular breeds all made a good showing, but a most prominent feature was the large exhibit of bantams and fancy fowls.

The ribbons for premium awards were exceptional in that there was not only the ribbon as usual, but in addition, a metal bar across the top with an opening for a slip showing what the premium is for.

LICE ON CHICKENS.

A small pinch of lard placed on the heads of chickens will knock lice stiff and it will not hurt the chicks. Lice are the bane of fanciers who raise pure-bred fowls and a great many ills can be traced to them. Bowel trouble, weaknesses of all kinds, going light, cholera, leg weakness in young cockerels, general debility and numerous others can all be traced to them. Lice revel in filth, and there multiply and take the flock down in a hurry. The combs turn black, and their bodies get so light in weight that the owners think they are really "going light," which is but another name for consumption. The only way to successfully combat lice is to fight them all the time.

Standard Bred S. C. White Leghorns

Queries and Replies

FERTILIZER FOR BERRIES.

Editor Cultivator: Please inform me through your columns what amount and what time to apply fertilizer to Logan and blackberries grown in medium light soil at Redlands.—G. R. S.

Nothing gives better results than good stable manure. Apply now, in generous quantities, and later plow and work well into the soil. You will hardly use too much.

PRUNING AND CULTURE.

Editor Cultivator: (1) What is the best time for pruning fruit trees, such as apricot, peach, pear, plum and apple, and how should grape vines be pruned to insure best results in fruits? (2) How can potatoes be prevented from becoming wormy? When first dug they were apparently sound and good, but after they were sacked and put away they became full of worms. (3) Is it best to water strawberries and keep them growing or should they be allowed to rest through the winter.—Mrs. B., Santa Barabra.

(1) Apricots are best pruned as soon as crop is off, or they may be pruned during the winter, which is also the time for pruning all other deciduous fruit trees. Grapes grown for various purposes receive pruning "each according to his kind." See article by Mrs. Sherman on page 499, issue of November 24.

(2) We have never heard of potatoes becoming wormy until after they had rotted, and this must be the condition of yours; immediate sorting is the only remedy.

(3) You will doubtless do best by letting your strawberries rest; seldom do they need watering in winter under any circumstances.

POTATO CULTIVATION.

This is a very important operation, and must be attended to at the proper time if the crop is to be kept clean and thrifty at a minimum cost. The neglect of a few days in one cultivation may mean the difference between profit and loss. Cultivation should begin by stirring the soil with a weeder or smoothing harrow within one week from the time of planting, and the operation repeated every week or ten days as long as the size of the plants will admit, the objects sought being to prevent crusting of the surface soil and the extermination of weeds before they have gained foothold in the soil.

The horse cultivator will next be of service in cultivating the crop, and should be run quite deep for the first cultivation, after which all operations should be shallow, as deep cultivation after the plants have become well established causes untold injury to the roots feeding in the top soil.

The amount of hand hoeing necessary will depend upon the thoroughness of the above operations and the amount of grass and weed seeds in the soil. If the weeding and cultivating has been faithfully done, the only necessary hand work should be in the removal of the scattering weeds along the row.

Blue Andalusians For Sale

Several pairs and trios of handsome Blue Andalusians. Exhibition or utility birds. Eggs for hatching, $2 for 15. ***Mrs. J. F. Duff, 3145 S. Hoover St., Los Angeles, Cal.***

United States Department of Agriculture, Climate and Crop Bulletin of the Weather Bureau, California Section, for the week ending Monday, December 11, 1905.

General Summary.—Cool and clear weather prevailed nearly all the week in the central and northern sections and frosts were of frequent occurrence. In Southern California the weather was warm, clear and very favorable for citrus fruits and farming operations until Saturday, when the most severe winds and sandstorms of recent years occurred, continuing through Sunday and causing great damage.

In the central and northern sections the rain of the preceding week was less beneficial than anticipated, owing to continued cool weather and drying winds, but in some districts the precipitation was ample for present needs and enabled farmers to resume plowing and seeding. As a rule the rainfall was not sufficient to start grass and feed is very scarce. The soil in the San Joaquin and Sacramento valleys is very dry and farm work is practically at a standstill, but conditions are somewhat more favorable in the coast districts. In Southern California the season has been unusually good until near the close of the present week, and early sown grain and pasturage were in excellent condition, but it is probable the drying winds and sandstorms have had an injurious effect on all crops.

It is reported that much damage was done to the orange and olive crops in Southern California by the high winds on the 9th and 10th. The storm extended over San Bernardino, Riverside, Orange, San Diego and Los Angeles counties. In many places the fruit was blown from the trees and in some orchards the trees were broken and uprooted. Orange picking and shipping are progressing in all sections and the crop is nearly all harvested in the Porterville district.

Eureka Summary.—Weather continues cool, with frosty mornings. Grass is growing slowly. Some plowing.

Los Angeles Summary.—Drying land winds during the week turned into severe norther Saturday, with sandstorm in the interior. Reports so far do not state effect except that a few say some oranges were blown off and trees uprooted.

Ventura County ranchers get five dollars per ton for baled bean straw, in the field. It is used for cattle feed mixed with beet pulp and in some cases it is fed to horses.

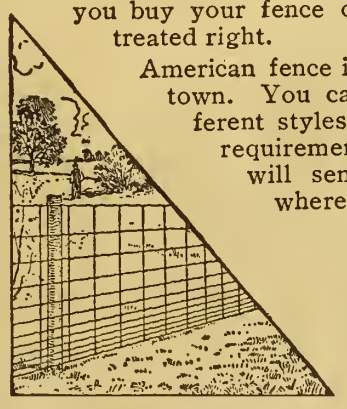
AMERICAN FENCE TALKS

BY THE MAKERS

The structure of the American Fence is perfect. It is built of big, solid, lateral wires, with the upright or stay wires hinged. This is the most perfect structure for a square mesh fence and is covered by patents which cannot be assailed.

There are many fences on the market. Some tell of their wonderfully hard wire; others speak of new forms of construction that make all other forms look ancient and worthless. But through all this it remains a fact that more miles of American fence are in use than of all others combined, and will continue so.

We do not sell direct—we sell through dealers all over the country. Only in this way are the buyers' interests looked after. The dealer becomes your business friend and when you buy your fence of him he will see that you are treated right.



American fence is for sale with the dealer in your town. You can find it there, examine the different styles and make a selection to suit your requirements. Or, write us direct and we will send you a catalogue and tell you where you can get the fence.

PROGRESS.

That we all are here through struggle,
through the fruits our fathers won,
Makes us brothers strong and worthy
in the course still to be run—
What shall say the end is useless, or
the mighty labor done?

Systems still are blown to atoms and
the earth will meet its doom,
In the eye of all the heavens man is
ever in his tomb,
But we see the smallest blossom still
outbursting into bloom.

Just alone that man is noble, just
alone that he have worth,
Just alone that he shall ripen what
was seed in him at birth,
Is a more imperial problem than the
end of all the earth.

Human progress still points peace-
ward and still further from the
brute—
Let the end be hidden from me, let
eternity be mute,
I will struggle on and upward as the
flower from the root.

J. Oppenheim in Youth's Companion.

Courtesy of Cal. N. W. Ry.

CLOVERDALE, SONOMA COUNTY, IN MIDWINTER.

Nestled away among the hills of Northern Sonoma County, in a little cove at the head of the Russian River Valley, lies the little city of Cloverdale—"The Citrus City of the North" with a population of about 1000, and incorporated as a city of the sixth class. Other places in California can raise their oranges, their lemons, and their olives, but none produce a better fruit, or with less care and attention, than does the Cloverdale citrus belt.

Miss Mattie's Relaxation

It was summer. The birds told that from the top of the old maple. Miss Wharton's one small maid announced it when she came in, arms akimbo, with:

"The ice is all melted entoirely, ma'am. Shall oi get some more, oi don' know?" And Miss Wharton's sewing machine announced it by a pile of thin stuff waiting to be made into dresses.

"I wonder now," said that young woman to herself, as she sat on the edge of her bed with last summer's gowns before her; "I wonder if I couldn't do something to this shirt-waist. If Mattie would stay at home for even one afternoon in the month. That would be quite parliamentary.' And it was only by the Lord's mercy oi didn't say oi'd like to lay her on the shelf. Here she comes now, ma'am, lookin' loike a carpse. Oi'll be afther makin' her a cup o' tay."

She looked as though she needed it, poor Mattie, as she threw herself into a great willow rocker.

"You looked fagged out," was the consolinig remark of her anti-club sister.

"Fagged!" said the energetic Miss Mattie disdainfully, "I'm as fresh as a northcaster. I been learning how to rest today. I suppose you think that resting should come 'sort o' nateral,' but it doesn't. Nothing is natural in these days. You have to be taught everything. I thought before I went to that rest club that I knew a thing or two—but I don't. I don't even know how to smile properly.

"Most persons have an idea that a smile means the general stretching of the muscles of the face. Not at all, my dear. When you smile you should use the upper lip only. Save the energy you would put into the lower one for some other time. So; Look at me, now!" And the poor deluded club woman put on a most agonized expression, stretched her upper lip in a spasmodic manner, and then let the muscles relax.

"Don't!" said Miss Wharton, feebly. "Don't learn how to smile. Nature never meant you to distort your face in that way."

"Distort!" exclaimed Miss Mattie, waxing eloquent. "Just wait 'til I've practiced it awhile. In a few days it will look better. If you could see that rest-teacher smile, there would be no greater advocate of the relaxing method than yourself."

"Just what do you mean by relaxing?" asked Miss Wharton.

Her sister looked at her pityingly. "Why, I mean," she answered vaguely, " why—a general giving in, you know. A general relaxing that is. The first thing that teacher said to us when she entered the room, was—'Now, ladies, rest yourselves.' Then she fell—yes, fell—into a chair, quite beautifully, you know. And the way she rested was a dream. Then we tried to do the same—and were nightmares.

"The trouble is we're not inanimate enough when we rest. We shouldn't think or breathe, unless we do it in the right way. Why, that woman has given us an exercise which, if we keep up, will make us Junos. She has already shown us how to rise from a chair gracefully. Simply poise yourself; get your equilibrium established and don't clutch at things. You always do that."

"When are you going to get the time to practice all this?" asked Miss Wharton, camly.

"Wait and watch!" replied Miss Mattie. "I shall ask you to help me this evening."

"No! It wasn't an earthquake or burglars that caused the unearthly sounds that night. It was simply the club-woman going through relaxing evolutions. Charming they were, and pleasant to behold.

"Are ayther av yez fallin' out av bed?" queried Annie, with her gentle Hibernian accent.

"Oh, is that you, Annie?" asked Mattie. "Come in here, please. I'm resting and—" There was genuine alarm on Annie's honest face, as she beheld her young mistress flat on her back on the floor.

"Now, here you," said Miss Mattie, as she waved her arms wildly about, "just lift my hand up by raising the wrist and I will use no force whatever and let it fall naturally. That is relaxing, you know." She declared it never hurt at all when her knuckles came thumping down on the hardwood floor, though she sent Annie for arnica afterward.

May kind fate preserve us from knowing how to rest. Miss Mattie "pawed" and "swam." She jumped and twisted, and became so utterly worn out in that resting process that she had to give up the next day's reading club. Annie tucked her in bed herself that night; gave her a cold lemonade and a pitying smile. Then, as she turned out the light and tiptoed softly from the room, Miss Mattie heard her mutter: "If she's not an insane lunatic, I never saw one. If iver the other is tuk that way, oi'll move to adjourn, begobs!"—Katherine Carmichael.

SHE WAS GRATEFUL.

Mr. Brown's business kept him so occupied during the daytime that he had little opportunity to enjoy the society of his own children. When some national holiday gave him a day of lesiure his young son was usually his chosen companion. One day, however, Mr. Brown, reproached by the wistful eyes of his seven-year-old daughter, reversed the order of things, and invited the little girl to go with him for a long walk.

She was a shy, silent, small person, and during the two hours' stroll not a single word could Mr. Brown induce the little maid to speak, but her shining eyes attested that she appreciated his efforts to amuse her; indeed, she fairly glowed with suppressed happiness.

Just before they reached home, however, the child managed, but only after a tremendous struggle with her inherent timidity, to find words to express her gratitude.

"Papa, what flower do you like best?" she asked.

How to Organize
A Farmers' Telephone Co.

We have published a very instructive telephone book especially for the man who wants to know ALL about telephone matters. It tells how to organize, how to build the lines; about different types of 'phones, construction; gives by-laws, and constitutions; in fact it is a telephone encyclopedia every farmer should have. We send it free if you mention this paper. Ask for Book 71C, "How the Telephone Helps the Farmer." You will get it by return mail. Address nearest office.

"Why, I don't know, my dear—sun-flowers, I guess."

"Then," cried the little girl, beaming with gratitude, "that's what I plant on your grave."—Woman's Home Companion.

THE DOCTOR'S PATIENT.

This story was told at a recent meeting of a medical society in this city:

A physician practicing in one of the smaller cities up the State was aroused at midnight by an inebriated individual who insisted that the man of medicine accompany him immediately to his home, three miles back in the country, says the New York Mail.

"Ser'ous case, doc," said the caller "Mush come 'medjtly."

The physician protested that his man was absent and there was no one on the premises who was able to hitch up the horse.

"'Sall right," said the insistent one. "I'll hitch 'm in shiffy. Showmeen."

"You understand, of course," warned the doctor, "that while my charge for a call in that district is $1 in the daytime, I'll have to charge you $2 for going out there at this time of night."

For answer the caller placed a $2 bill in the doctor's hand.

They went out to the barn, the stranger hooked the horse up in no time at all, and they set out for the back country at a good pace. Arriving there, Sawbones asked to see the patient. The inebriate one tumbled out of the buggy and leered at the other as he said:

"I'm ze only patient. Tell yer how 'tis, doc. I went zer li'vy stable, see! Asked liv'ryman how much sharge take me home. 'E sez $4, 'n I sez's outrache. Sez I kin git home for $2 'n sez 'e'l bet $10 I can't. Mush 'bliged t' you, doc, r' puttin' me $12 ahead of the game."

What the physician said was not reported for publication.

HIS HOUSE WAS NEARER.

A Springfield clergyman is telling a story of his last vacation, which is probably better appreciated by his fellows who have served the Lord in the villages than by those members of the profession who have ministered only to the city charges.

"I took over a pulpit in a little country town about twenty miles from here," he says, "conducted services to an end, then waited for the usual invitation to dinner. Because of some reason it did not come. I was hungry as a bear; so, finally, in desperation, I approached a prosperous looking farmer whom I had met before the service and said: "Brother, won't you come home with me to dinner?' 'Gladly, parson,' he answered, 'where do you live?' 'About twenty miles from here,' I answered, as airly as possible. For one moment he looked dumfounded, then he saw the fun of the situation, and his hard old face broke into a thousand wrinkles as he grasped my hand and said: 'Parson, let's go over to my house for dinner. It's a heap nearer than yourn.'"—Boston Globe.

As a rule women are more liberal than men. The wife who has a mind of her own is continually giving her husband pieces of it.

Probably nothing jars a man like the discovery that he has been sucking a suspender button for ten minutes under the impression that it is a cough lozenge.—Chicago News.

Cookery Recipes

GRANDMA PHELP'S PUMPKIN PIE.

The Los Angeles Express says: "This pie is made by 'Grandma' Phelps, who is famous all over this well known pie belt as a maker of the pumpkin delight. Mrs. Phelps could, if she would, make pies from daylight to darkness and still hear calls for 'more!' She has written out her recipe expressly for this newspaper.

Cut up a part of a pumpkin, wash, and boil with the rind on until well cooked.

Run through a colander to separate rind from pumpkin.

To make two pies take a quart of the pumpkin and mix it with the following:

Two eggs.

Two-thirds of a cup of granulated sugar.

One teaspoonful of ginger.

One-half teaspoonful of cinnamon.

A pinch of salt.

Enough sweet milk to bring whole to the right consistency.

Pour on crust in tins and bake in moderate oven until nicely browned.

Grandma Phelps doesn't give a recipe for the crust.

"No use telling a woman what to put in it if she can't make the crust," she says, and what Grandma Phelps says goes.

* * *

BEATEN LAYER CAKE.

Put in a bowl 2 cups of flour, add 2 teaspoons of baking powder; beat the yolks of 2 eggs, add to them 1 cup sugar and the rind and juice of one lemon; add the flour and powder to this, and 2 cups cold water and a pinch of salt, then add the whites of the 2 eggs, beaten stiff. Bake 15 minutes in a hot oven. A very nice and good cake for lunches. Try it, sisters, and you will always use it.—A Lassie.

* * *

BREAD PUDDING.

If one has some cornbread left from a previous meal, by all means use that. Take equal parts of cornbread and white or graham bread and break up in a pudding dish. Cover with sweet milk and let soak for twenty minutes at least. Beat one egg until it is very light, and then add it with sugar (to taste) and spices, or the preferred flavoring, to the bread and milk. Bake in a moderate oven for about half an hour. Serve cold with whipped or plain cream.—Winnifred.

* * *

POTATO AND MEAT SCALLOP.

Here is a good and tested recipe for supper or dinner. Prepare raw potatoes, sliced thin, twice the quantity of any cold meat you may have, roast or boiled beef, lamb or veal. Chop one onion fine, put a layer of potatoes in the bottom of a buttered dish, then a thinner layer of the meat and salt, pepper, butter and onion, and proceed, scallop fashion, having the last layer potatoes. Pour over any left-over gravy and plenty of water, cover and bake one hour.—A Lassie.

* * *

BOILED FISH.

Editor Cultivator.—I would like to tell the readers that in boiling fish it is not necessary to do it up in a cloth; but put an onion in the water with the fish. It will not taste and the fish will remain whole. Now that eggs are high, use a teaspoonful of cornstarch for one egg, putting it in the last thing.—Mrs. G. B., Los Angeles.

HOMELY HINTS.

Nearly everybody knows that charcoal is the safest and most efficient disinfectant and purifier in nature, but few realize its value when taken into the human system for the same cleansing purpose.

Charcoal is a remedy that the more you take of it the better; it is not a drug at all, but simply absorbs the gases and impurities always present in the stomach and intestines and carries them out of the system.

Charcoal sweetens the breath after smoking, drinking or after eating onions and other odorous vegetables.

Charcoal effectually clears and improves the complexion. It whitens the teeth and further acts as a natural and eminently safe cathartic.

It absorbs the injurious gases which collect in the stomach and bowels; it disinfects the mouth and throat from the poison of catarrh.

* * *

Rapid eating is slow suicide.

A lump of sugar saturated in vinegar is efficacious in most cases of hiccough.

In sleeping in a cold room establish a habit of breathing through the nose, never with the mouth open.

A severe paroxysm of coughing may often be arrested by a tablespoonful of glycerine in a wine glass of hot milk.

To compel a child to eat anything against which its palate naturally rebels is a cruelty at the moment and is likely to produce evil effects later on.

A few drops of the tincture of benzoin put into the water in which the face is bathed will prevent the shiny appearance of the skin with which so many people are affected, especially in warm weather.

A GOOD BEEFSTEAK.

This, from an article on Bohemian life in Paris by Thackery, is enough to make a strict vegetarian hold up his hands in horror:

"After the soup, we had what I do not hesitate to call the very best beefsteak I ever ate in my life. As I write about it now, a week after I have eaten it, the old, rich, sweet, piquant, juicy taste comes smacking on my lips again, and I feel something of the piquant sensation I then had. I am ashamed of the delight which the eating of that piece of meat caused me.

"G. and I quarrelled about the soup, but when we began on the steak, we looked at each other and loved each other. We did not speak; our hearts were too full for that. But we had a bite, laid down our forks, looked at each other, and understood each other. There were no two individuals on this wide earth, no two lovers billing in the shade, no mother clasping her baby to her heart, more extremely happy than we.

"As you may fancy, we did not leave a single morsel of the steak; but when it was done we put bits of bread into the silver dish and wistfully sopped up the gravy. I suppose that I shall never in this world taste anything so good again."

Los Angeles Markets.

Los Angeles, Dec. 14, 1905.

Butter and cheese remain unchanged, while fresh ranch eggs have dropped 5c from last week's quotations, but lower grades remain unchanged. Potatoes are scarce and firm as quoted, as are tomatoes and peas. Onions are firm and an advance expected soon. Fresh deciduous fruit in fair supply, and the market easy. Citrus fruits are coming in for the holiday trade and selling fairly well.

VETERINARY DEPARTMENT

BY DR. W. J. OLIVER,
318 East Second St., Los Angeles.

To the end that this department may be made as valuable to the subscribers as possible, we ask observance of the following: Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease ap eared. Give your name and address, which will not appear in the paper if you so request. No charge whatever is made for such questions as are answered through the colums of the Cultivator, but when an immediate mail answer is wished Dr. Oliver asks an additional fee of $1.00 and will give immediate attention and reply by mail. In such case write Dr. W. J. Oliver, 318 E. Second St., Los Angeles, Cal.

Questions should be in by Monday to be answered in the following Friday's paper.

CONGESTIVE CHILL.

Editor Cultivator:—I have a cow which calved two months ago. Since then, at times only, she has developed a hardened section in udder (left hind portion), which passes away during twelve hours. I rubbed it and bathed with hot water and applied lotion. The portion affected was sore to the touch. The day after she was bred she went down in her milk flow and her stomach seemed compacted, also a little gas formed; her breathing somewhat labored and appetite almost gone.

When first taken sick she seemed very hot and had shivering fits in hind quarters; her tongue appeared to be swollen. I gave her first night seven teaspoonfuls of spirits of turpentine and half a pound of salts; her bowels moved slightly, and since then in the course of thirty-six hours I have given her two pounds of salts. She only, as yet, has had slight motions and her stomach still seems compacted.

Since stricken I have only noticed her chewing her cud once for a very short while.

Have fed her slightly on good alfalfa hay, giving her warm water drinks; have kept her in warm barn.

I am always interested in your valuable veterinary department, and will be greatly obliged if you will kindly name disease and give a a remedy for same.—"Joey," Gardena.

Your cow took cold and had a congestive chill. She should have had a good stimulant at the time. The salts should have cleaned out the stomach and bowels so that she would have digestion established and chew the cud.

Give teaspoonful of the following twice a day:

Nitrate potash, 1 pound; nux vomica powder, 4 ounces; willow charcoal, half pound. Mix.

* * *

WARTS ON TEATS.

Editor Cultivator:—As I am a subscriber to your valuable publication, I would like to ask you to print in the Cultivator a remedy for warts on cows' teats.—C. P. E. Hynes.

Clip the warts off with small pair of sharp scissors, close to teat, then touch the parts with pencil nitrate silver.

* * *

PREVENTING HEAT IN COWS.

Editor Cultivator:—What kind of medicine is used to stop a cow from coming in heat every month? We have had considerable trouble with our cows this year. They will come around several times before they catch. They say that there is a medicine that will stop such trouble.

We have a cow that is nearly a bull herself. She is in heat all the time. We have to keep her from the herd. What is the cause and is there a remedy?—J. J. G. & Co., Pomona.

Teaspoonful iodide potassium once a day will be beneficial.

The Las Vegas Land & Water Co. have just completed the installation of their water system at the new town of Las Vegas, Nevada City, Utah. This ranges in size from 4 to 18-in. and will be operated under 60 pounds nominal pressure and 100 pounds fire pressure. An ample number of both single and double nozzle independent acting hydrants were connected with the system throughout the town. All fittings furnished are cast iron and Crane's standard valves were used throughout. The pipe used is Machine Banded Redwood Stave Pipe made by the National Wood Pipe Co. of Los Angeles, California, who installed the entire system. This pipe is especially adapted where alkali conditions prevail with acidulated [illegible] water strongly mineralized.

Waite, Bailey & Lynch, buy, sell, exchange, repair and install gasoline and steam engines, boilers, air compressors, power pumps, etc. Otto gasoline engines, all sizes, to 200-H. P., better built, more economical, therefore superior to all others; prices and terms that will insure due consideration. 943-945 N. Main st., Los Angeles, Calif.

FACTS ABOUT CANCER.

A new booklet published at considerable expense by L. T. Leach, M. D., of 416 Main street, Dallas, Texas, tells the cause of Cancer and instructs in the care of the patient. Tells what to do in case of bleeding, pain, odor, etc., and is a valuable guide in the management of any case. It advises the best method of treatment, and the reasons why. In short, it is a book that you will value for its information. It will be sent by mail, prepaid, on receipt of ten cents, stamps or coin.

The S. J. Smith Machinery Co. will move this week into their new storeroom, 212-214 South Los Angeles street, Los Angeles, Cal., where they will have one of the handsomest and best equipped machinery salesrooms on the coast.

FOR SALE

One Holt 65 H. P. Agricultural traction engine, with extra wide wheel base, with water wagon, plow cart, and all necessary attachments.

One Holt Junior Combined Steam Harvester, fully equipped.

Six Stockton Five-Gang Plows, Disc, Seeder, etc.

All in thorough repair, and used but two seasons; for sale on account of lands being subdivided, and sold off by the Chino Land and Water Company.

Chino Land and Water Co.,

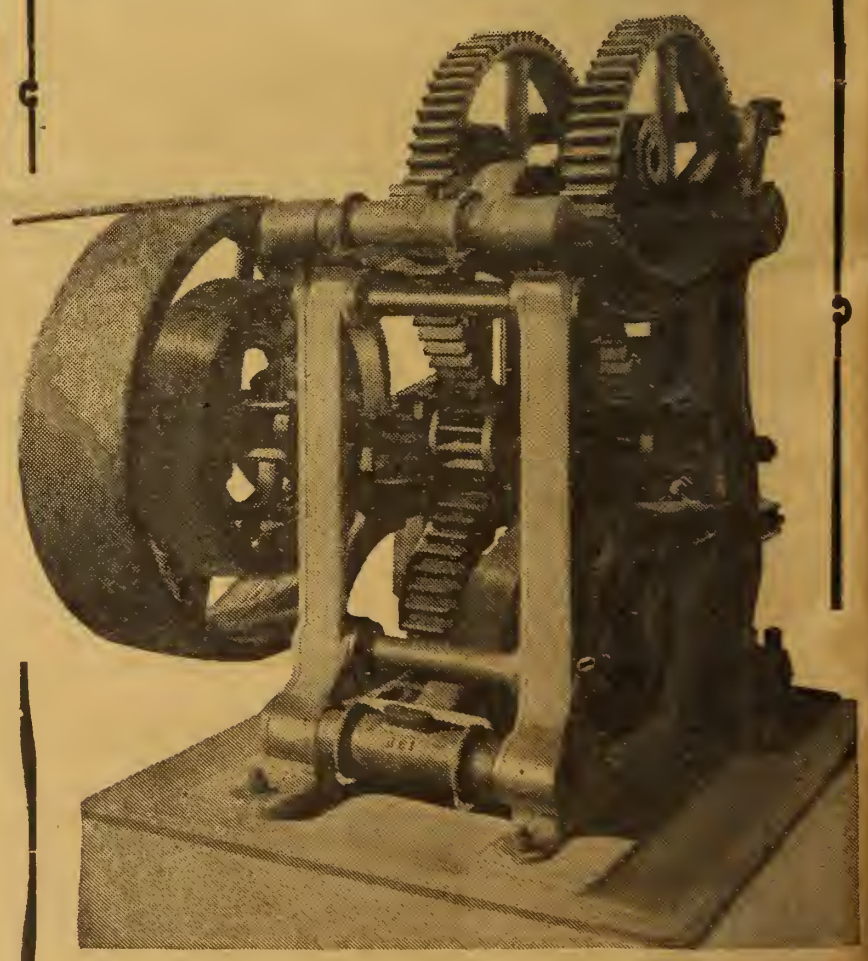
The Record for the New Pomona Pumps

FOR 1905

Not a Broken Rod, Not a Plunger Pulled for Repairs



The irrigation season just closing has demonstrated fully the high merit and efficiency of the New Pomona Pumps.

Every one installed has passed through the season's run without breaking a rod or requiring the valves to be pulled for repairs, proving conclusively that the ideal beam motion used by these pumps is more than has been claimed for it.

The slow, uniform motion upward and the quick, smooth down motion handles the rods without any jerk or jar, while the long lap of the plungers in passing the dead points, keeps the water column in continuous motion upward and a steady stream flowing from the discharge pipe.

They have passed through the experimental period and are built better than ever for next year.

The ideal pump for irrigation purposes. Send for catalog.

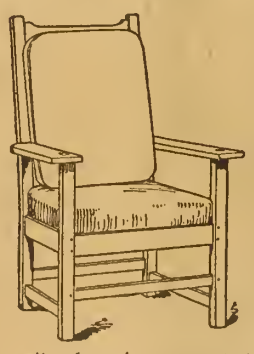
"Dependable Furniture at a Fair Price."

True Mission Furniture



The Old Mission styles of furniture are the most favored and the most used now. The plain, simple lines and the peculiar finishes of the weathered oak and the dark rich mahogany are decidedly pleasing and are in strict keeping with the bungalow form of architecture which is so popular in this section of the country. There is a greater diversity of style and finish even in these special lines and just as great an opportunity exists for inferior workmanship. The mission furniture from the factory of the famous craftsman, Gustav Stickley, is acknowledged to be the finest in the country—made entirely by hand even to the smallest parts and every joint is mortised and pinned and made to fit perfectly We are agents here for this superior furniture and constantly carry a large and selected stock. All mail orders given prompt attention.

The Annual Flow of the Yule-Time Tide

By E. A. Routhe

All Christendom stands with its face to the East on Christmas morning, and millions listen to the story of the Babe at Bethlehem. The little Child is supreme on that day. The little ones rule the hour and the "old folks" occupy a space in the background. In the unwonted freedom of the hour one sees a living picture of "joy unconfined." The ruling spirit is that of kindliness, which finds its best expression in gift tokens which go, in the main, as reminders of personal regard as well as in the observance of the sacred side of the occasion to comemorate it. In that miraculous birth was the leaven that lightened the burdens of mankind and from it sprang the cradle song of the Christian world. And after that, Calvary became the "Excelsior!" of the youth in all Christendom in the onward and upward march toward the apex of human perfection.

The Christmas of 1905 will be held in the memories of the children of this land of the blest as a day of peace as well as a day of joy. The dove and the olive branch now adorn our national pennant, and war's dread alarms have no disturbing sense in the bosom of this, our beloved republic. Therefore, because, of this peace, and the attendant prosperity, there is glee in the air. The sounds of rejoicing come from everywhere, and all the world to us seems to be in a merry mood. Business in nearly all the ordinary occupations of life is suspended for the nonce. The National Congress has taken a recess; the great manufactories have "slowed down" to give the operatives a brief respite of cheer; the schools have gone to play, and the elderly elements assemble at the festal board to do honor to "that fellow-feeling which makes us wondrous kind" and to discuss the turkey and plum pudding as well.

At eventime the churches are ablaze with lighted jet and waxen candle, and the "Gloria in Excelsis" pours in vibrant melody upon the ear with inspiring force. Now can the devout hearer and the staid, careworn man-of-the-world feel alike the joys of peace and security. From Plymouth Rock, on the storm-lashed shores of the Atlantic, where the Pilgrims sang their peans of joy to the "Peaks of Darien," where Balboa lifted up his voice in gratitude for his first view of the placid Pacific, there rises a song of cheer, of peace and of unity. But to consider critically some of the phases of our national prosperity, one should not follow the volition of mere feeling so far as to overlook anything that is not exactly in harmony with the ethical spirit of Him whose birth we celebrate in this fleeting hour, when we would "fling dull care to the winds." Reflecting just a little, it does seem the rewards have not been distributed in proportion to the individual endeavor in all cases. If the returns had been more generally distributed, so to speak, in proportion to the expended energy of those bearing the brunt in the strife there would be a greater diffusion of cheer. In corroboration of this some of the independents in productive industries can testify to that.

While Rockefeller's stocking may sag down a good deal heavier than some others, Santa Claus did not fill it. And yet poor John is in hiding from the officers of the law, in awe of a simple subpoena, a fugitive from justice, and the butt of the merry-making world. What happiness! What joy his must be today.

Picking La Marque Roses at Yule-Tide

While there are not as many independent lines of railway as there were a year ago, Gould and Harriman, as rivals, have extended their respective systems by the process of absorption; and each one waxes merry at the thought of how he outflanked the other fellow—especially when they mail to each other an "annual" with the compliments of the season.

While banking institutions have increased in number beyond all precedent in history, J. Pierpont Morgan prescribes their limitations, although as he walks or sleeps he enjoys(?) the presence of an armed body-guard—just for fun.

While Armour II, king of the meat trust, has been compelled to show his hand in the matter of rebates on shipments and to also pay a pretty little fine for violation of the law, he goes right on cheerfully fixing the market price on cattle at from $18 to $28 per head for steers that he formerly paid from $40 to $65 for before the formation of the meat trust. He may do expiation for his worst wrongs by an extra contribution to the Armour Institute as a Christmas gift, but that will not popularize him with the farmers nor condone his offense against the law of ethics or the statutes.

But this is digression. How far away one may be led, who stops to observe, if not to think. One might have mentioned the strenuous doings of Schwab and the steel trust, simply to note what a world of "richness" it is furnishing the public in its business and social operations, but lack of space and time forbids—so let it go at that.

This day of merry-making, of which so much is written, like all other mundane things, has its kaleidoscopic phases too. There are many points of view from which to contemplate it. Those in the stress of want will find little within themselves that is responsive to the spirit of the hour. The pangs of hunger, the scantiness of garb, the inadequate shelter, the humiliation of the proud spirited in poverty dispel the native warmth of the heart and dull all senses to gaiety or joy. One of the best features of this occasion is to search out those who hide in the shadows and to impress them in the most practical way possible that they are not forgotten. It is pleasing to know that much of this is done. Food, fuel and raiment are sent to the helpless poor, flowers and delicacies gladden the hearts of those in hospitals, and even those under the ban of the law, by some token, are reminded of the day. The miser and the cynic form two classes who find no merit in the day more than in any other day. They are the chumps of the world. Even money would not make them happy, for there is no real enjoyment in the possession of money unless you can use it in making others happy. Now just how it is from the standpoint of Russell Sage or Mrs. Hetty Green one may leave it to the reader to guess. Whatever estimate they make of this holiday phase of human life one can feel assured that it will not be anything like that of Helen Gould and Andrew Carnegie.

In the consideration of these and kindred thoughts which thrust themselves before one even when trying to be cheerful, in chastity one fain would quote:

"In men whom men condem as ill
We find so much of goodness still.
In whom men pronounce divine
We find so much of sin and blot,
We hesitate to draw a line
Between the two where God has not."

How many pleasant surprises are planned for the good of friends and especially to please the loved ones nearest the heart. At this period old Santa Claus goes out in guises innumerable. Youth in its glowing exuberance and buoyancy, middle age in the zenith and fullness of strength of life, old age, reposeful and austere in its mature dignity, all join in the pilgrimage—all almoners in disguise—all bearing the burden of some precious secret—in search of something to please.

Christmas Day in Southern California, under the bright sunlight, amid the waving palms and myriads of

(Continued on Page 599)

PEAR BLIGHT IN CALIFORNIA.

For a long time the cause of this disease remained a mystery, and much discussion regarding this malady, most of it of little interest at the present date, occurred in the horticultural societies and in the horticultural press. In 1878, Prof. T. J. Burrill of the University of Illinois, one of the pioneer plant pathologists of this country, discovered the bacterial nature of this disease and named the microbe which causes it. This discovery was all the more striking and fundamentally important as it was one of the first, if not the first bacterial disease of plants to be discovered. Since the initial discovery of the bacterial nature of the disease, investigations of its nature and the life history of its microbe have proceeded along the lines of modern bacteriological methods.

The writer was assigned to the task of thoroughly investigating this disease in the spring of 1889, and several years were devoted almost exclusively to this work. With the points gained by other investigators, and aided by the experience of very many practical orchardists in almost every state in the Union, the result is a very complete knowledge of the disease, and, as complete knowledge about any disease and its parasite usually results in some national method of control, I am enabled at the present time to lay down a practical and feasible method of controlling, if not of completely wiping out this disease in the pear orchards.

* * *

Host Plants.—The disease is usually most serious on the pear. It attacks the apple, however, to a very serious extent, sometimes disastrously. The quince, the wild crab-apple, the various species of hawthorn, the service berry, the mountain ash, and other related fruits are more or less subject to its attacks. The loquat, which is a relative of the pome fruits, is a somewhat peculiar host for this disease. Fortunately, California has scarcely any wild hawthorn or crab-apple, and there are usually no thickets of those related fruits in the vicinity of the orchards, so that in eradication work the orchard alone, or perhaps the ornamental grounds, in addition, are all that need attention.

* * *

External Appearance.—The blight usually first attracts attention in the spring of the year, a month or so after the blossoming period. It is then found that the flower clusters are shriveling and dying. Perhaps if examination had been made very carefully the blighting blossoms may have been noticed for some weeks previous. About this time the twigs are also found to be dying. In some cases, the new shoots are seen to be attacked at the tip, and the disease is running downward, killing the tender twigs completely and running down on the bark of the twigs and branches.

* * *

Factors Which Determine the Spread.—These factors may be divided, more or less completely, into two sets—those which govern infection, and those which determine the spread of the blight in the tree after infection.

* * *

Factors Governing Infection.—The first factor is the presence of the bacillus. The pear blight germ must be present in the orchard or must be carried in there during the season in order to have the blight. No matter how favorable the conditions may be, unless the germ is there, the disease cannot develop. The immunity of the California pear orchards up to recent years, of course, is attributable to the fact that the germs were not here. Second—the number of insect visitors. We have pointed out that insects carry the blight about. The honey-bee is one of the most active in carrying the blight on the blossoms. Other insects visit the pear and apple blossoms and carry the blight very widely, sometimes exceeding in importance the honey-bee. The presence of some certain species of insect, as already suggested, has been the means of introducing the blight into the twigs and branches or bodies of the trees. Not only must the insects be present, and the germs there for them to carry, but the weather conditions must be favorable for the activity of the insects and to bring the tree into the proper condition for infection. However, visiting insects usually like sunny weather, especially sunny weather following a moist season, which allows many kinds to hatch out or develop from the pupa.

PROF. M. B. WAITE.

PRUNING RASPBERRIES.

The canes of the red raspberry are biennial; that is, the fruit is produced on the wood that is two years old. Shoots of the canes grow from the roots the first year and fruit is borne on them the second year. By heading back the young shoots in the summer, more lateral branches will be produced on which fruit is borne. The root is perennial and if the raspberry plant is properly cultivated and pruned, it can be made to live indefinitely and bear well.

In pruning pluck out all the dead canes, cutting them close to the ground. Then thin out the remaining canes to about eight or twelve inches apart. Head back the young shoots to an average height of from two to three feet, depending upon the variety and growth of the plants. A good hedge shears or pruning shears are good tools to use in pruning raspberries.

The black raspberries, or black cap raspberry, has biennial shoots and sends out canes from a perennial root. However, the black cap does not increase from suckers, but grows from a hill plant and propagates by rooting at the tips of the branches. In order to make the plant stout and thrifty, summer pruning should be practiced. This consists in cutting back the young canes when they are 1½ to 2 feet in height. If this is adhered to ,strong lateral branches will be thrown out which will make strong, vigorous canes. All affected canes should be burned. When pruning leave from 3 to 5 canes to a hill. Head back the lateral branches from 12 to 18 inches in length.

THE ADDITION OF HUMUS TO SOILS.

As the humus has such a decided influence over the condition of plant food in the soil, the addition of it to a soil more or less depleted, or naturally deficient, must always be kept in mind, in the consideration of any system of fertilization.

While the time-honored method of supplying humus in the shape of stable manure is still not to be neglected, yet much of its effectiveness is lost from the presence of so large a quantity of straw, which forms humus quite slowly. Care should always be taken to save as much of the manure as possible, but the more modern way of utilizing certain plants as nitrogen catchers, and humus formers, thus improving the moisture and general physical condition of the soil, is by far the better method for the horticulturist, who generally has a limited amount of stock from which to derive manure.

Humus secured in this manner is both superior to and cheaper than that from animal manures. The plants generally most available for this purpose are peas, vetches, lupines, or any of the clovers. In California the selection should be made of one which makes a fairly rapid winter growth, so there will be a considerable mass of succulent matter to turn under in the early spring. The particular value of the humus obtained from this source lies in the fact that the material is green and succulent, and easily decomposes, and that this class of plants is rich in nitrogen, thus producing a more lasting effect than the humus obtained from stable manure. These plants, thus distributing the organic root surface, which extends much deeper into the soil than most other plants, thus distributing the organic matter to greater depth than other plants. They are at the same time larger users of lime, phosphoric acid, and potash than the other classes of plants, and consequently leave a larger proportion of these ingredients in the material distributed in a fairly available form in the soil.

Leguminous crops are also great users of nitrogen. They not only utilize all the soluble nitrogen within their reach, but also avail themselves of the nitrogen of the air, through the medium of a system of bacteria which they harbor upon their roots, and which serve to manufacture nitrogenous food to supply their host plant. The necessity for their using such large quantities arises, at least in part, from the fact that they have to furnish nitrogen in considerable quantities for the successful operation of these bacteria.

For most general application, the Canadian Field Pea has given the best results as a green manure crop in California. The handling of a pea crop, outside of the seed, does not cost more than the handling of the soil without it, and there is added to the soil, the fertilizer with which they have been fed, in addition to the nitrogen which the crop has been able to gather from the air, and the entire amount then becomes the plant food for the main crop grown upon the land.

Right at this point it must be plainly understood that a pea crop brings neither potash nor phosphoric acid to the orchard, as it obtains all its supply from the soil on which it grows. Further, unless these two elements are present in the soil in an available condition, the pea cannot take up and elaborate the nitrogen of the atmosphere. We should so feed the pea crop then, with potash and phosphoric acid, that it can make the greatest possible use of the atmospheric nitrogen. The fact that we make use of peas as a green manure makes it really the more necessary that we use additional amounts of the two mineral fertilizers, potash and phosphoric acid. The effect of these is not lost through the pea crop, but they enable it to do more work in the elaboration of the nitrogen, and at the same time the potash is saved for the use of the fruit crop of the succeeding year, since by turning under the peas, we leave in the soil all the ingredients which the crop has required for its growth.

Phosphates and potash should always be applied before the pea seed is planted, whether the planting is done broadcast or in drills. The fertilizer may be either sown broadcast or, if the seed is to be drilled in, strewn along where the rows are to be, and subsequently mixed with the soil. A fair application would be 300 pounds acid phosphates, and 100 pounds muriate or sulphate of potash per acre. In some cases, on account of the lack of soluble nitrogen in the original soil, the plant may appear sickly and yellow. When this condition is observed, the addition of about 75 pounds of nitrate of soda per acre may be used as a top dressing, but to avoid injury, it should be first mixed with four or five times its bulk of dry earth, but as a rule this is unnecessary, and only the potash and phosphates need be supplied.

GEO. WRIGHT.

BLACK SCALE PARASITE.

During the summer of 1898, I found on trees in San Bernardino County some black scale (Lecanium oleae), that were evidently diseased.

I brought samples of these scales to our laboratory in Los Angeles, where cultures of the fungus, which was apparently getting in its deadly work, were made. Subsequently many cultures of this fungus were made and were distributed widely through our scale infested districts. In some districts the work was quite effective that season. Mr. A. B. Smith of San Dimas, had his ranch cleaned up by this fungus. In other places the disease seemed to make little headway.

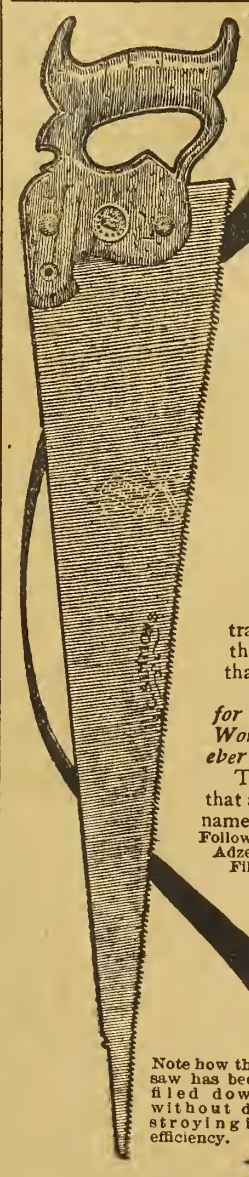
Believing that a disease is by far the cheapest method of getting rid of our scale pests, this department has persistently continued to make cultures annually, and has distributed them widely through Southern California. These have thrived, more or less indifferent, for a short time and then disappeared. This year the results were quite different, and I find that this fungus disease has been doing effective destruction in many localities, and it would appear to have become acclimated and I trust has come to stay, although it seems to have been "winter killed," for several successive years.

The fungus is grown in Petrie Dishes, i. e., cultures are made of it on pieces of sterilized bread about 2 inches in diameter. When the cultures are made they can be kept a long time, under proper conditions, ready at any desired time for application. At the proper time three of them are mixed with a barrel of water at a temperature of about 70 degrees Fahrenheit. Such a barrel containing 45 gallons of water is enough to spray 1600 trees. I have done this by merely spraying, through an ordinary hand syringe, say one pint of the mixture on a tree. Every fifth tree is enough to put the spray upon.

On one tree at least wet a limb infected with the scale with the mixture and wrap with piece of cloth also wet with the mixture (a cloth about 2 inches wide and 3 feet long, will answer). This cloth should be kept moist for a week, thus enabling the spores to get a start upon its host. If the fungus gets a start on any tree it will more than likely spread, not only over the orchard, but throughout the neighborhood.

It is evidently desirable that tests should be made as extensively as possible of this method of destroying the black scale, and the work will be continued by this department.

S. M. WOODBRIDGE, Ph. D.



Saw Service

A good example of the remarkable service given by Keen Kutter Tools is shown in the Keen Kutter Hand Saw illustrated here. This saw was used for *twelve years* by a carpenter, who pronounced it the best saw he had ever used in thirty years experience; and as perfectly satisfactory in *every respect.*

And every other tool in the Keen Kutter line is as good a tool of its kind as Keen Kutter Hand Saws

The long life of tools bearing the

KEEN KUTTER

trade mark is not chance or accident. It is due to the fact that nothing is spared to make Keen Kutter Tools the best that brains, money and skill can produce.

The Keen Kutter Line has been Standard of America for 36 years and was awarded the Grand Prize at the World's Fair, St. Louis, being the only complete line of tools ever to receive a reward at a great exposition.

Think what it means to you to be able to buy the best tools that are made, of every kind, simply by remembering the one name—Keen Kutter.

Following are some of the various kinds of Keen Kutter Tools: Axes, Adzes, Hammers, Hatchets, Chisels, Screw Drivers, Auger Bits, Files, Planes, Draw Knives, Saws, Tool Cabinets, Scythes, Hay Knives, Grass Hooks, Brush Hooks, Corn Knives, Eye Hoes, Trowels, Pruning Shears, Tinners' Snips, Scissors, Shears, Hair Clippers, Horse Shears, Razors, etc., and Knives of all kinds.

If your dealer does not keep Keen Kutter Tools, write us and learn where to get them.

E.C. SIMMONS KEEN KUTTER TRADE ST. LOUIS MARK REG.

Every Keen Kutter Tool is sold under this Mark and Motto:

"The Recollection of Quality Remains Long After the Price is Forgotten."

Trade Mark Registered.

TREES

ROEDING TRUE TREES FRESNO, CAL.

True to Name

It is of the utmost importance that young trees, shrubs and vines for planting be true to name. They must also be well rooted and properly prepared for shipping and planting. Such are the trees from our nurseries.

We have four separate nurseries, comprising over eleven hundred acres, in different sections of the country, each having its peculiar soil best suited to the special requirements of different trees, shrubs and vines for their perfect development. It is a costly method for us to pursue, but it enables us to grow the very best on the market.

CALIMYRNA FIGS

Over fourteen years of careful experimenting with the growth of the Smyrna fig, or fig of commence, in this country were requlred before we could say that we had been entirely successful in propagating this valuable fig, and for the past five years we have been growing this fig in its perfection, drying, packing and marketing it.

CALIMYRNA R FRESNO

There are several varieties of the Smyrna fig, but with our varied experience in this line we feel warranted in recommending one, the Calimyrna, as the most profitable and best for all commercial purposes. We are able to supply almost any desired quantity of these superior trees.

We protect the Calimyrna Fig with the seal shown herewith, which is attached to each bundle of ten trees.

We make mention of our superior stock of

PEACHES, PLUMS,
PRUNES, PEARS,
APPLES, APRICOTS,
CHERRIES, OLIVES,
NECTARINES, ETC.

These trees are all grown in our nursery plant, No. 3, which has a rich river bottom soil, permitting the most perfect rooting. Our

ORANGES,
LEMONS,
POMELOS,
LIMES,
CITRON

And all of our citrus fruit trees are grown in our nursery at Exeter, which has a deep, rich, black loam and is particularly suited to this particular line. All of the standard varieties will be found in our stock of strictly first-class trees.

GRAPE VINES

As we are the largest growers on the coast of the best varieties of raisin, wine and table grapes and also make a specialty of vines grafted on phylloxera resistant roots, we are in a position to fill your orders most satisfactorily.

CATALOGUE FREE

Our catalogue, in either English or Spanish, is profusely illustrated and gives a good idea of the immensity of our stock. We mail it free to any address on receipt of 5c postage. Price list mailed on application.

BOOK YOUR ORDERS NOW

If you are contemplating doing any planting in the future it would be well for you to place your order as early as possible. We will book your order now and ship your stock when it is desired.

Paid-Up Capital, $200,000.00.

FRESNO, CALIFORNIA

California Horticulturally

By John Isaac, Sacramento, Cal.

VALUE OF OUR FRUIT OUTPUT.

In his address before the late Fruit Growers' convention at Santa Rosa, Governor Pardee said:

"Our expert estimates that the real value of California's fruit and fruit products is $50,000,000 or a sum equal to the combined values of our mineral products and our cereals, whilst another very competent judge places the figure at no less than $80,000,000."

We are inclined to the belief that both of these estimates may be correct, if they apply to fruit and products, which they probably do, as they are used for illustrating the value of the orchard and vineyard industry to our state. The products of citrus, fresh, canned and dried fruits, including raisins and prunes, will undoubtedly reach the former figure, while, if we add to the fruit products, wine, brandy and other manufactures of the vineyard and the orchard, the larger figure will undoubtedly be reached.

* * *

Increasing Importance of the Fruit Growers' Conventions.—The thirty-first Fruit Grower's convention, held at Santa Rosa, the first week in December, was one of the best attended and most interesting of any ever held. We have seen a larger attendance, but this only in more populous centers and within reach of a larger number of orchardists, but, all conditions considered, the meeting at Santa Rosa was the best attended and the most interesting and valuable ever held. It is pleasing to note the increasing interest being taken in these conventions and the wider scope of the programmes. Heretofore methods of production—planting, pruning, cultivating, etc.—have been the chief topics considered, but as we have become better and better versed in these operations, they have gradually ceased to be the most important, and better methods of packing and marketing have taken their place, while many of the papers are of a purely scientific character, and these are listened to and appreciated by the attendants. There is a very evident improvement in the tone of these fruit growers' conventions, indicative of deeper research and a broader knowledge of science as it relates to the industry considered.

* * *

California an Apple State.—California has awakened to find that she is an apple growing state, and it is somewhat of a surprise to her. Ever since we can remember in California we have been told that it was no use trying to grow apples here because they would not do well. No, California might grow other fruits but not apples. When asked why, we were gravely informed that everybody said so, and that settled it. But we are growing apples, more and more each passing year, and each season sees a greatly increased acreage of new apple orchards set out, until it begins to look as though the state which couldn't grow apples will yet become one of the great apple producers of the Union. The crop of the Pajaro section alone, only one, although the most important apple section of the state, this year passes the 3,000 carload mark, and all things favorable this will reach 3,500 for the coming season. Beside this there are large quantities raised in the Lompoc section, in Mendocino and Sonoma counties, besides large quantities through the mountain counties. Altogether there is now probably between 6,000 and 7,000 carloads of apples produced in this state annually. This branch of fruit growing is practically the growth of a very few years, for while apples have been grown to some extent in our state from the earliest period, long before the American occupation, it is only of late that it has been thought that they could ever be a profitable crop, and even now the idea that we cannot grow apples is firmly grounded in the minds of some of the old inhabitants, and the statements here given will come as a surprise to them. Apples can be successfully grown in two great sections of California; in the counties on the Pacific ocean, and in the higher mountain valleys. In the coast counties the proximity of the sea moderates the temperature, there is no excessive heat and the apple has found there ideal conditions of climate. In the mountains we have almost an Eastern climate—frost, snow and long, cold winters, very favorable to the hardier apple, and the two sections produce two different classes of fruit, the light colored varieties giving better results on the coast, while the red varieties appear to do better in the mountains. There is yet vast areas of good apple land in both of these sections and a good chance for this industry yet to equal if it does not rival citrus fruit in our state.

* * *

Rain Needed in the North.—The northern portion of the state is very badly in need of rain again. So far there has been but one rain storm worthy of the name, and even that was a very light one, and was followed by several days of north winds which dried up what little moisture fell. We have now arrived at Christmas time and so far have not had sufficient rain to start the plows. Feed is very poor and stock in many sections is beginning to suffer. There is still ample time to make good crops and to have a good season, but for all that our farmers are becoming anxious.

* * *

No Organizations of Dried Fruit Men.—The effort to organize the dried fruit men of the state has resulted in failure, and it is evident that the individual growers are rather inclined to go it alone than to pool their interests and work together co-operatively. In view of the unsettled condition of the prune market and the ruinously low prices prevailing for that fruit, a committee was appointed at the San Jose Fruit Growers' convention for the purpose of taking steps to organize the prune growers into a co-operative body, for the purpose of marketing their products, and it was fondly hoped that, profiting by the failures of the past, some working system could be evolved and successfully inaugurated. To this end A. R. Sprague, chairman of the committee, laid two propositions before the growers, one being a profit-sharing plan, by which capital was to be induced to enter into combination, in order to swing the crop; the other was a purely co-operative proposition, and the growers were asked to express their choice. Nearly 4,000 postal cards, all prepaid, were sent out to prune men in the state, and all they had to do was to put a cross against the preferred plan. Out of all this mass of cards, but 210 were returned. It was a rather remarkable exhibition of apathy on the part of a class of fruit growers who were suffering more than any other class, but while to be regretted, was not altogether unexpected. Several efforts have been made to bring the prune growers together, and in every case there has been failure followed by loss on the part of those who were most faithful to the principle of co-operation. So, in view of the indifference on the part of those most concerned, the organization of the prune growers has been abandoned until the need is greater or the opportunity is more propitious.

CITRUS FRUITS

By C. A. Day. Pasadena

SPRAYING CITRUS TREES.

I read with interest Mr. James Mills' letter giving his expericnce in spraying citrus trees with distillate mechanical mixture. Mr. Mills in his letter makes the following important points:

Condition of scale at time of spraying. Testing of the distillate, turpentine and water for the mixture. Condition of trees and irrigation before spraying. Contract work. Expert in charge of machinery and the spraying.

These points are well taken but it will be difficult for the average grower to procure an expert for the machinery and spraying, and where the grower or a combination of growers wish to do their own work, it will be necessary for them to learn the details of the work as done by an expert. For this reason Mr. Mills' letter is lacking in an important part, the working of the machinery and the application of the spray. I have no doubt but that Mr. Mills will be glad to furnish the readers of the Cultivator the information desired.

While I am not in the spraying business, I have had a great deal to do with spraying and the inspection of sprayed orchards, and am aware that a great deal of the spraying, in fact a great majority of it, is not up to the mark set by Mr. Mills. I believe some important points in the details of the work are overlooked. One of these is the pressure and the nozzle.

High pressure and a nozzle throwing a fine spray, breaks up the mixture of distillate and water. This thoroughly mixes the oil and water, giving to all parts of the wood and foliage an equal strength of the distillate, which not only prevents injury to foliage but by the equal distribution of the oil is more effective on the scale. It is a well known fact that the oil and water separates quickly after the agitation for mixing ceases. It is therefore reasonable to expect some separation of the ingredients of the mixture in its passage through the hose and a coarse nozzle.

The high pressure and a fine nozzle breaks up the mixture into fine particles as it is thrown upon the tree. If the above reasoning is correct, the engine should be at all times in good working condition and able to maintain the required pressure. There have been instances where the contract sprayer carries a sample nozzle to show what is being used, but the nozzle in use has been tampered with and throws a coarser spray. Another important thing to be considered, when an orchard of thick topped orange trees are to be sprayed, is the removal of the dead wood and of all useless wood beyond that necessary for fruit bearing. A close topped and untrimmed tree will not admit the equal wetting of all parts of the wood, and we all know that a large part of the black scale on the wood is located on the under side of the branches at the outside of the tree with a close topped tree and the branches laying on top of one another there is not a good opportunity to reach all of the scale. I believe the spray should be thrown directly upon the scale. Carelessness of the sprayer often leaves portions of the tree untouched or not thoroughly wet.

Many of our growers who buy and operate spraying machines, secure a workman who has formerly worked for a contract sprayer, and as a result the work is no better than the average contract work and sometimes not as good. In fact, much of the work done by growers themselves is not equal to the work of the commercial sprayer.

The condition of black scale and its irregular hatch makes spraying in coast portions much more difficult than at interior points, as at Riverside, for instance.

Young, vigorous orange trees in coast sections, very frequently have the black scale hatching from early spring, through the summer, and would require more than one spraying. The first spraying should be timed when the young scale are not too far advanced to be killed. The fall spraying, from this year's observation, should be given in the month of September as the scutellista at that time are numerous enough to parasite all the old unhatched scale.

As to possible injury to trees, a tree highly fertilized and under intensive culture, will be less liable to injury than one in a debilitated and run-down condition. The strong, vigorous tree is better able to withstand the possible injury from poor oil.

FLORIDA ORANGES.

Judging from the following "spasm" which appeared in the editorial columns of the last issue of The Western Fruit Grower, St. Joseph, Mo., the editor is in a condition to appreciate the luscious Navel oranges California is now sending East:

"For years Northern markets had no oranges from Florida, for the trees down there had been killed by a severe winter. During this interval we were told of the good, sweet oranges which formerly came from Florida, until it was with great joy we received the announcement a year or two ago that Florida was to be a factor in the orange market again. But, alas! Florida oranges are not living up to their reputation, for the reason that growers are shipping them before they are ripe. Florida oranges have been on the markets for several weeks, but it is safe to say that the average person who buys them, after he learns where they are from, resolves that henceforth he will pass the Florida fruit and wait for oranges from California. The fruit has been green and very sour. Florida growers should see that this condition of affairs does not continue. They should not allow their fruit to be shipped before it is ripe, else they will disgust the consumers with their fruit. It will not do to say the consumer ought to know enough not to buy green fruit—the fact is simply that he knows the Florida fruit is bad, and the result is that the growers are apt to 'kill the goose that lays the golden egg.'"

In the midst of his chuckling over the apparent superiority of the California orange now in the market our grower should see in this comment a warning against the shipment of green fruit from any section.

The Rural Press: Lemon growing near Fair Oaks is becoming one of the leading industries. Many orchards are now coming into bearing. Owing to the fact that the lemon tree thrives on less water and poorer soil than the orange, there are many localities where a special advantage is gained in planting to lemons.

A VALUABLE INNOVATION.

The Citrus Fruit Association of Ontario has adopted a system whereby careless fruit pickers may be held up and possibly lose their job in their not exercising more care in the gathering and handling of oranges and lemons.

The system is as follows: Every picker will have his individual number, and every time he picks a box he will put into that box of fruit a ticket bearing his number. When the fruit is delivered at the packing house the inspector examines it, and if he finds any fruit with too long stems, or damaged by the clippers or otherwise marred by the picker, he takes the ticket, gives it to the grower delivering the fruit, who having the number is not long locating the clumsy picker.

This happy scheme will be good news to many growers who have lost considerable through the carelessness of some pickers, and who seldom have been able to locate the party to whom the blame should attach.

The scheme will no doubt prove such a good one, in that it will put more dollars in the growers pockets, that all packing houses will adopt the same system.

OLD-FASHIONED FLOWERS.

They aint no style about 'em,
And they're sort of pale and faded;
Yet the doorway here, without 'em,
Would be lonesomer, and shaded
With a good deal blacker shadder
Than the Mornin'-glory makes,
And the sunshine would look sadder,
For their good old-fashioned sakes.
—RILEY.

BEAUTIFY THE BACK YARD.

At this season of the year, when everybody about the farm is busy, it seems almost impossible for any one to find time to plant flowers and vines to beautify the back yard, but with all that, don't neglect this one thing, for in the hot summer days, when the worst of the hard work is over and you have a chance to sit down for a short time in the heat of the day, you will miss a nice, cool, inviting spot, where the vines are covering all the bare and ugly sheds and the flowers are in bloom.

The front yard no doubt is already planted, but don't on that account neglect the back yard. There is, perhaps, an old fence, or tree-stump, or even an old wood-shed, that will be a good spot for some vines, or the old-fashioned but brilliantly colored flowers —hollyhocks, petunias, four o'clock, etc.

Don't spend all your time on beautifying your front yard, but give the back yard some attention—you will not regret it.

FARMER ORFF.

NATURE STUDY IN RURAL SCHOOLS.

There is no doubt of the necessity for work of this kind with the children. The love or antipathy of the farm is engendered at a very early age in the minds of the young. This has been demonstrated when we have farms and who still desire to do so to raise their hands, and we almost uniformally find that the number who desire to live on farms is far less than those who actually live on them. With these childern, ranging from six to fifteen years of age, the question of pecuniary profits upon the farm has appealed very little, but they are influenced directly by the environments under which they are living. These environments must be improved; and if they are, there is every reason to expect that children will love the country better than the city. We have thought, therefore, that it is eminently worth the while to instill the love of nature and the knowledge of a multitude of living things in the minds of the children; and by so doing we are fully convinced that we shall also be spreading the very same knowledge and impulse to the parents of these children. In fact, all are fully convinced that the fundamental method in improving the agricultural status is to begin with genuine and attractive nature-education in rural schools. As soon as a genuine interest in these matters is awakened in the children and teachers, school gardens, cabinets of plants, insects and minerals and other enterprises will cluster about the school-center, and the influence thereof will spread throughout the community.

RURAL IMPROVEMENT WORK.

The higher the culture the more harmony and beauty demanded by all the senses, and we are well into the century which will see the beautifying of country homes and villages with flowers brought to marvelous perfection. Flowers are within the reach of the poorest. A rich person may buy beautiful objects of art and hide them away in his house, but his flowers must grow in the sunshine where we can all see them. They grow as finely for the cottage as the mansion. Nothing tells more quickly of refinement within the home than flowers outside it.

Village improvement work is one of the most beautiful thoughts of the day, and there is no end to the work it opens up. In small towns it may well take the place of the board of trade of the cities. Let us hope the people all along the line are alive to its advantages. For, after all, it lies with the people themselves to say to what extent this improvement work shall go. In the midst of all a few farmers or villagers may decline to join the work, and thus become an eyesore to the tireless little company of workers who have done so much for them. It will also cause thousands of visitors to wonder what makes those homes and farms less prosperous than others.

The go-ahead, progressive part of the population of towns will withdraw one by one, leaving the lazy ones to their weedy streets and tumble-down fences, and the progressive farmers will welcome purchasers for the farms of their less thrifty neighbors. Will it pay you to allow your property to deteriorate for the lack of a little exertion on your part? Not in this age.

MAKE NATURAL FLOWER BEDS

One fault with our flower-growing is the flower-bed. Now, nature has no time to make flower-beds; she is busy growing flowers. And, then, if she were given to flower-beds, the whole effect would be lost, for she could no longer be luxurious and wanton, and if a flower were picked her whole scheme might be upset. Imagine a geranium-bed or a coleus-bed, with its wonderful "design," set out into a wood or in a free and open landscape! Even the birds would laugh at it!

We should grow flowers when we make a flower garden. Have enough of them to make it worth the effort. We sympathize with the man who likes sunflowers. There is enough of them to be worth looking at. They fill the eye. Now show this man ten square feet of pinks, or asters, or daisies, all growing free and easy, and he will tell you that he likes them. All this has a particular application to the farmer. He grows potatoes and buckwheat and weeds by the acre; two or three unhappy pinks or geraniums are not enough to make an impression.

FLOWERS BRIGHTEN FARM LIFE.

During the past few years the best thoughts of many able men and women have been given to the condition of the farmer and the status of agriculture. Many movements looking to the betterment of rural affairs are now in progress. It is probable that every one of them is productive of permanently good results; and the combined efforts must be most beneficent. However, the pecuniary side of the agricultural question has been too greatly emphasized in these schemes. It is, of course, incontrovertible that the greatest single problem is that of the earning power of the farm; but it is not nine-tenths of the question, as one might conclude from current agricultural discussions.

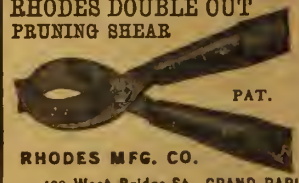
Great numbers of farmers earn enough as it is, but they do not have the knack of doing things with the greatest economy of time and effort, and farm homes are not often designed to afford the greatest pleasure and comfort in living. Every person should know the great fact that the most successful life is the happiest one, and that the happiest one is that in which the common and little things awaken the greatest number of mental impressions. Successful and enjoyable farming, therefore, depends largely upon one's attitude of mind towards the things with which he deals and lives. If one derives pleasure from a daisy, a hill of potatoes, and a pigweed, then each of these plants is practical and worth the growing.

Like or dislike of the farm is often and probably generally formed before the child is old enough to be influenced by the profit-and-loss side of farming. A pleasant and happy home is the very first means of keeping the boy on the farm. One means of making the home attractive is to brighten the place with flowers.

AMMONIA FOR POT PLANTS.

Common washing ammonia is an excellent fertilizer. Add one tablespoon to about three quarts water and thoroughly water the plants with this once a week for a period of about six weeks. You will notice a marked change in growth and color as well as in the bloom.

RHODES DOUBLE CUT PRUNING SHEAR



Cuts from both sides of limb and does not bruise the bark. We pay Express charges on all orders. Write for circular and prices.

In the Vegetable Garden

VEGETABLE GROWING.

Vegetable growing is an important branch of horticulture, and in order to grow those esculents successfully and raise them in prime condition, either for family or market use, the aspirant for success requires both skill and tact, in order to receive a fair financial return for his labor. Probably any person of ordinary intelligence can do so, yet at what an expense to the palate as well as to the pocket of the grower. In order to grow them to perfection it requires care, keen appreciation and good judgment. Given a modicum of practical knowledge of agriculture, dexterity in the use of modern implements, a fair start in a salubrious climate and a productive soil, and there is every reason to believe that the intelligent California farmer can achieve success in this department of agriculture sufficient to elevate it as a branch of rural production far above the limited resources and primitive methods of the long-queued Oriental.

In order to simplify garden or field operations and avoid difficulties that might arise during the routine of planting, etc., a systematic plan should be drawn out on paper, divided out in plots, in order to ascertain the number of plants and the amount of seed to be planted or sown.

It need hardly be stated that if the land selected for cropping be ineffi cient in nutritive qualities the enriching of the soil is absolutely necessary in order to insure a fair crop of sound and well flavored vegetables. Well decomposed barnyard manure is an excellent fertilizer and may be used in ample quantities to put growth-giving vigor into the deeply plowed and well-prepared soil.

Operations for spring gardening should commence early in February. At this time may be sown onions and broad beans, such as the green Windsor, also lettuce, carrots, radishes and the earlier varieties of peas. Sow in boxes toward the end of the month peppers, tomatoes and egg plant. Protect them from frost if outside the frostless belt, and secure them with sufficient shelter from the hot sun when coming through the soil. Your plantation in the open ground must be attended to when freely growing and watered during a dry spell. When the rains come, plant cabbage, onions and peas for winter or spring use. Sow also turnips, lettuce and radishes; these are hardy and will serve you in winter and early spring.

Where there is a family of young children they should certainly be encouraged to cultivate a garden. There is nothing so eminently successful in cultivating the young faculties as the study of the vegetable kingdom, from its study we gain intellectual strength and it refines and moulds young minds to gentleness and perception.

Apart from the general interest which the children should take in the family garden, they ought to own a small plot for themselves where they could raise small quantities of fruit and vegetables for exchange and sale. They should not attempt too much at first, but cultivate a few things to begin with and add to their stock as they gain in knowledge and expertness. They should also form a "juvenile horticultural club," and hold, at least once a year, a prize show, where premiums would be given for the best exhibits from the products of their gardens. This would add interest to the work and induce them to keen application in the performance of their various gardening operations.

Of course the children's garden would contain more than vegetables. All around their garden there should be a narrow border of flowering plants. These flowering plants must or should be raised by themselves, either from slips or seeds. And so that there may be peace and good will amongst the young gardeners each of them may cultivate a separate plot of their own, under the supervision of the gardener, father, or mother, the elder sister or brother, or anyone capable of directing their horticultural operations. Gardening is such a pleasant recreation that few of those that are attracted by its seductive influence ever forsake its benignant shrine, nor ever regret the extent of time devoted to its manifold methods and various operations.

ASPARAGUS IN CENTRAL CALIFORNIA.

The production of asparagus in Central California has reached a height of perfection probably unsurpassed anywhere in the world. On the Sacramento and San Joaquin rivers are five canneries which pack this luscious vegetable. Three are in Sacramento county—one at Sacramento, one at Trasks Landing and one on Grand island. On Boulden island, at the junction of the Mokelumne and San Joaquin rivers, just south of the Sacramento county line, there are also two large canneries which pack asparagus. There is still another at Milpitas, in Santa Clara county. The canneries at Trasks, Grand island, Milpitas and Bouldin island pack asparagus exclusively.

To get the best results the canneries have to be established in the neighborhood of the asparagus beds, because in a few hours after cutting the asparagus becomes tough. The entire asparagus stalk, if cooked within a few hours after cutting, is tender, while if kept longer, only the tip itself is tender enough to eat. This is the reason why asparagus properly canned is all edible, while of market asparagus, as a rule, only the tip can be used.

For canning the stalk is cut just as it indicates its presence by raising the earth. The knife is run down below the surface of the ground, and it is then cut, perfectly white in color. It is "processed" within two hours after being cut. There is quite a difference in results between asparagus processed two hours after it is cut and that which is processed in from thirty-six to forty-eight hours, so far as tenderness, flavor and color is concerned. Light turns the shoots green. The canning process is very simple, and nothing is used to make the product keep; simply cooking in salt and water and excluding the air.

The plant is very sensitive to conditions of climate, soil, etc., and to get the best results in packing a combination of favorable circumstances is requisite. The peaty soils of certain river islands have been found especially well adapted to this culture.

Of late years there has been much planting of asparagus on islands in the delta of the Sacramento and San Joaquin rivers, where the soil conditions are especially favorable. Three years are required from the time of setting out the roots before the beds are in proper condition for cutting a good crop, though sometimes shoots are cut the second year. The edible shoots begin to appear in January, and the early shipments bring high prices. In March the season for canning opens, the asparagus being then abundant.

THE FARMER'S GARDEN.

When pa spades up the garden I
would give about a shilling
If you could see him when he quits.
Oh, gee! but he looks killing!
One breeches leg above his boot, his
right hand gallus busted,
A dirty rag around his neck—gee whiz,
but he's disgusted.

There is nothing the farmer will or can do that will give greater pleasure in his household than to provide them with the vegetables that may be produced from the farm garden.

The garden with many is of secondary importance. After the field crops are planted, if there is time to spare, their thoughts are turned toward the farm garden, and some potatoes are planted and, possibly, a small piece of sweet corn (too often the corn is omitted in California gardens). Should it be a surprise to any that the good housewife, who is ever on the alert for delicious vegetables for the table that should be found in the garden whrere nothing but potatoes, field corn and wheat can be found, becomes discontented and sick of the farm? It is not necessary to enumerate a list of vegetables that should be grown in every farmer's garden. But don't scrimp the garden plot; make the rows long that a horse cultivator may do most of the work of keeping the weeds in subjection.

Ranch for Sale

To close an estate, we offer 33 acres near Compton, for sale. Choice alfalfa land. Best artesian well in that section. Water to sell. Address

THE CHRISTMAS SPIRIT.

Once each year only comes to all the opportunity to be generous for the pleasure which giving brings. Not that we do not receive happiness from generous giving at all times, but on this day of all the year, when the spirit of Christ everywhere abounds, there is a special happiness in putting one's hands into the pocket and taking therefrom the glittering gold with which to make others glad. His must be a little soul indeed which does not receive new joy in making another happy by some token of remembrance on this day of hallowed memories than in the thought that his money jingles in his purse.

It matters not how trivial may be the gift, if it is in proportion to the ability of the giver it will always carry with it joy to the recipient. Our little people are so easily made happy. The poorer in wordly riches the father is, the happier are his children when Santa Claus fills their stockings with a few small gifts of Christmas eve. There is somehow, in the mind of every child, the keen desire to be remembered at Christmas and the disappointment of neglect weighs more bitterly in its heart than the loss of a fortune to the man of the world.

But the little ones are not alone in this desire to be remembered. We older ones become children again, the night before Christmas, and wonder to ourselves if we may not share in the general rejoicing of the coming morning by some kind act or thoughtful remembrance on the part of some one we love best. Because it is only from our dearest friends that we expect to receive a token of regard on Christmas day.

I remember once, "back in the old home town," to have seen a child weep bitterly the day before Christmas because the father had been taken from the family and the mother was too poor to buy presents for the little ones. "There will be no Christmas at our home tomorrow, for papa is gone, and Santa Claus won't come when papa isn't here to meet him."

Santa Claus came to that little girl and to her brothers and sisters, and the happiness of that day in that humble home, was never equaled in the castles of royalty nor in the palaces of the world's most opulent rich.

* * *

For once enter into the joys of the occasion with the children. Remember they are looking forward with pleased anxiety to the coming of the Yuletide and are laying their plans for the gifts they have in their hearts to bestow, do not cripple them in this or treat their desires with indifference nor rob them of that which will give them so much happiness, but accede to their wishes as far as possible and try to enter into their feelings and study them in the light we looked at things when we were boys and girls. Make this queen festival a day of delight, gladness and good cheer.

There is a well timed maxim that "to him who giveth to the poor lendeth to the Lord," and with what measure of happiness we give is joy returned an hundred fold.

"Soon the bells will be ringing
In the holy Christmas morn,
And our hearts will all be singing:
'Christ in Bethlehem is born.'"

Chysostum in 386, in a Christmas sermon at Antioch, states that the 25th of December was the proper date for the Christmas festival, and called it the principal feast.—Schaff.

* * *

Christmas is always a time for gladness. Well may it be, for we celebrate it as the holy day of the calendar—the aniversary of humanity's deliverance from the thralldom of superstition, doubt and fear; the birthday of Him who linked the experiences of life with the hopes of Heaven, who joined the realities of time with the certainties of eternity. The man of sound mind, clear conscience and pure heart ought to be sincerely happy at Christmas time. Then, too, the holiday season brings to us the commencement of a new year. To the thoughtful man this is always a significant season. He may not indulge in "new resolutions," which may or may not be of value to him, but he realizes that another step has been made in the majestic march of time; that another link in the century chain is forged; that the human race is one mile stone nearer to its ultimate destiny. He wonders what may be in store during the next twelvemonth. The New Year may mean much to you if you improve the opportunities as they come and go.

* * *

Northern California Oranges.—For some years the claim has been made by Northern California that its oranges were of a very superior flavor and color. It was not expected, however, that the claim would ever be made that they can rival the fruit grown south of the Tehachapi, but the ambitious horticulturists of Butte and Tulare counties come forward with the claim that the oranges shipped from their respective counties has made a great hit in the Eastern markets.

The Sacramento Union, notes with much gratification, that a car load of choice oranges reached Chicago, from Palermo, in Butte county, in time for Thanksgiving, and that they were received by the lovers of California's royal fruit with marked satisfaction. The Union says:

"It must not, of course, be supposed that the oranges that saved the situation in Chicago constituted the first consignments from Northern California. That would be a grievous error, for Tulare county carried off the palm for the earliest harvest and the first shipments. Tulare oranges are said now to be half way to Australia, and although they do not have a Thanksgiving day in Australia except where a few exiled Americans may be gathered together, the oranges will be just as nice for the Christmas festivity, which is common to all Christendom. Northern California is therefore to be congratulated upon her achievement in making Thanksgiving day a success in Chicago. Without the oranges it could have been nothing more than a partial success. Considering the extent to which the northern part of the state has been denied her due in the matter of orange culture, some little self-congratulation becomes not only permissible but laudable."

We feel sure that the gratification expressed by the people in Northern California, at the success they have secured, will be felt also by the entire State. What builds up one section, no matter along what line is reflected on the state at large. It all goes to the benfit of California in the end.

* * *

To Shut Out Orientals.—Representative McKinlay has introduced in Congress a bill to extend the provisions of the Chinese Exclusion Act to Japanese and Koreans. It seems the entire California delegation is unanimous on this question, and the bill will be pressed to passage this session if possible.

We do not believe it will meet the endorsement of the Senate, as a number of Eastern Senators doubt the advisability of exciting the prejudice of more Orientals, at this time, because of the trouble we are having with the Chinese boycott, which is costing the government an enormous loss in trade. One thing is certain, the Chinese and Japanese are no more objectionable than the hordes of Slavs, Italians, and illiterates from other countries, who are coming to this country. Better amend the immigration law as a whole and shut out all undesirable aliens who never will make good American citizens. That's the thing to do.

* * *

Pure Food Movement.—There is a general movement throughout the country looking to the enactment of pure food laws in states. Congress has before it a pure food bill which may be worked this session, but its efforts will be supplemented by the local boards of health which are moving along the same lines.

The prosecution of several of our city milk venders for selling milk that was below the standard in quality or purity is an important step in the growing movement for pure fods. Dealers in milk who have erred by design or from want of knowledge are not the only offenders, as it is a fact which has been well established that many articles or preparations of food are adulterated or reduced below standard. for which manufacturers and packers are most often to blame, though dealers who, from their desire to buy cheap or to undersell others, buy inferior articles are also to be blamed. They may be ignorant sometimes of the deleterious nature of their wares, but when the cost price falls below what they know that a pure article ought to cost they cannot be ignorant.

It is an encouraging sign of progress that many manufacturers are advocates of legislation to maintain the purity of food, and that there also are manufacturers whose methods are such as to make their names a guaranty of absolute purity and cleanliness. We have an example at a packing house in our own city of a system of preparation and packing that insures the most cleanly and pure product.

There is a proverb which says that the good Lord sends us food, but an entirely different power sends us our cooks, but the really devilish work is done by the manufacturer who adulterates food articles and palms off deleterious stuff under guady labels and high-sounding names.

* * *

FARMERS' INSTITUTE.

Last week four successful institutes were held in that very interesting and comparatively new country, the Coachella and Imperial valleys.

Land reclaimed from the great Colorado desert and made to blossom as the rose. The most wonderful fertile land in the Union. A Brobdinagian land where everything grows and develops gigantically. Trees were shown to the visitors less than two years old that measured 36 inches in circumference, and everything in similar proportions.

The institutes were well attended and were ably conducted by Mr. J. B. Neff of Anaheim, who also took part on the subject of trees and how to fight the melon aphis. The favorite subject was canteloupe, on which an able essay was given by Mr. Leap, who has successfully raised them for three years. Asparagus was an interesting theme by Mr. R. B. Thayer. He told of his work in this line and described asparagus as growing to a height of four feet the first year from the seed.

Cattle and hogs—the best breeds for that country were discussed by Professor Major of Berkeley University, a thorough expert in this line, who could and did give reasons for his faith in the various breeds.

Mr. F. Kellogg of Goleta was the expert on dairying. His advice for every dairyman to have a good pump brought down the house, and all appreciated the valuable information he gave. His talk upon the boys and how to bring them up and keep them satisfied with their home was good.

The poultry question elicited much interest. for those valleys seem a paradise for fowls of all kinds—many herds of turkeys numbering up to eight hundred head proved money makers, whilst chickens and ducks were to be seen galore on almost every farm. The absence of fogs and rain make the chicken and turkey interests a perfect success. The abundance of alfalfa only two years old, but apparently five feet high, gives the necessary green food.

At each place visited, Thermal, Brawley, Imperial and Holtville, there were newspapers with reporters at all of the institutes, and there was evidence of energy and progressiveness of the whole country.—B.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

The Imperial Press says Prof. Mills of Pomona is the best posted man in the state on Malaga grape growing.

The San Fernando Fruit Growers' association shipped a carload of second grade oranges last week which netted it $1.00 a box. So says the Press.

Five hundred and eighty-three cars of oranges have been shipped from Lindsay, Tulare county, up to Saturday of last week, states the Lindsay Gazette.

The Earl Fruit company has been awarded gold medals by the Portland exposition for their exhibit of cherries and apricots grown on their Vaca valley orchards.

The Whittier News states that C. W. Leffingwell has shipped this season 150 cars loads of lemons and 25 car loads of oranges. He is enlarging his packing house.

The Apple Growers' Association of Los Angeles held its monthly meeting on Monday, at which Nelson Ward of Compton read an instructive paper on the apple in Los Angeles County.

The California Promotion Committee figures that California will ship more than 20,000,000 gallons of wine and brandy this year. This State produces, according to the committee's statement, 70 per cent of all the grape wine.

The California horticultural exhibit has been returned from Portland, says the Sacramento Union, and is now in the basement of the Capitol. Mr. Isaac intends, should it be found practicable, to have part of it displayed in the office of the horticultural commission.

There were shipped East from the Watsonville country this season, says the Analy Standard, 3,600 carloads of apples. The railroad charged the growers $358 per car freight on these 3,600 cars of apples, bringing the freight bill on the same up to the enormous sum of $1,288,800.

The grape crops in the dry wine districts of northern California are short this year. The best estimates place the shortage at one-third of an average yield. The weather conditions early in the season were not favorable, and then a "hot wave" late in the summer did considerable damage in Sonoma county. The price of dry wine grapes was good, although in some places the wine will be only of fair quality, as the grapes were heavy in sugar.

The San Francisco Chronicle thinks packers should encourage the olive industry in California more than they do by paying the best possible price for olives delivered, or on the trees, as the acreage is not nearly sufficient to satisfy the demand of one large concern alone. The land in Yuba, Butte and Yolo counties is especially adapted to this industry and as the harvest of the olives comes at a time when the other farm work is over, there is ample time to give this fruit proper care in marketing it. Cheap land, plentiful water, favorable climatic conditions and a ready market combine to make California the best place on earth for the successful propagation of olives.

This is the way the San Francisco Chronicle dishes up the Fresno raisin contention: There is an awful row in the Raisin association. Mr. Kearney has been back from Europe for some time, and when he is in Fresno in the raisin season he is usually a storm center. He is president of the Growers' association, having become a member and contracted his raisin crop for six years. The Fresno papers state that while remaining president of the association, and an exceedingly lively minority of one in its governing body, he repudiates his contract to deliver his crop to the association on the ground that it is a combination in restraint of trade! Such a situation, we think, is unique. So far as we can judge from reading the Fresno papers the whole intricate structure of the raisin organization is likely to go to pieces.

AGRICULTURE.

There is talk of organizing an agricultural association with race track attachment at Visalia. Tulare city wants the farmers to enlist in a membership agricultural association.

The Pacific Coast Railway shipped more grain and beans to city markets last week than during any week this year, the aggregate being about 530,000 pounds, says the San Luis Obispo Tribune.

The Imperial Standard says: "With the closing of the threshing season for alfalfa various districts of the valley are being heard from in regard to yield of seed. On the Heber ranch of Fuller Brothers, where from 40 acres only was threshed 9,620 pounds of choice seed.

Horticulture Commissioner Smith of Riverside County says that the potato and olive crop this year will be the largest since 1892. The onion crop in San Jacinto will average twenty sacks to the acre. The honey crop will be about 600 tons. The almond and walnut crops are the best in many years.

The olive mills are now putting out 2,000 barrels of flour a month and are running day and night. The monthly payroll is $800 and between $10,000 and $12,000 is also paid out monthly for grain, while the sales run up to about $15,000. The company buys all of the best grade of wheat it can find in this portion of the state, but is also compelled to purchase large shipments from Kansas. It also buys corn, barley and oats in large quantities.—Anaheim Gazette.

Within the next few days an innovation in farming in Sonoma County will be introduced on the Cotati Rancho, eight miles north of that city. Risk Brothers, who own and rent nearly 1000 acres of that celebrated rancho, have decided to experiment with steam plows upon their vast acreage. They have secured a hugh traction engine and will attempt to run eight large plows by the power furnished by this engine. The plows will be kept running night and day, two crews will be used.

Riverside county has an area of 7,000 square miles, with 933,210 acres assessed. Last year more money was received for oranges than for any other product, $5,377.495, the lemon crop aggregating $1,055,145. Next in value to the orange crop is the grain output, which totals an even $2,000,000. The dairy output was $408,850 and the honey totaled $92,335 in value. Of fruits other than citrus, peaches led with a value of $53,000. the prune crop being second with a value of $48,000. Pears were $16,000, apples $14,000, almonds $10,500, grapes $8,230, strawberries $6,500 and vegetables $45,000. Poultry sales were $117,130. Manufactured products aggregate in value about $500,000.

MISCELLANEOUS.

Sonoma County has attracted a small company of settlers from the Big Bend country in Washington.

The sulky in which Lou Dillon, 1:58½, the "Queen of the Turf," made her memorable records, has been purchased by Thomas L. Hehir of Santa Rosa.

H. W. Dockham, editor of the Lindsay Gazette, has been held to answer before the superior court of Sacramento County in a charge of criminal libel preferred by A. R. Sprague. His bail was fixed at ..500.

A woman saved the maple trees in the Chico public park. The park commissioners decided that the maples were retarding the growth of the orange trees and decided to cut them down. A gang of men was started at work, and notwithstanding the protests of the business men had destroyed a dozen, when their work was discovered by Mrs. Bidwell, who made a personal appeal to the commissioner and they quit.

LIVE STOCK.

E. Manier of Globe, near Placerville, has shipped 375 turkeys for Christmas.

The Dairy and Produce Review states that a new receiving station for cream will be established in the near future at Dos Palos.

The price of milk at Lodi has been increased from $1.50 to $2.00 per quart per month, and for pints has been increased to $1.25.

The State Dairy Commission of California proposes to inaugurate a most vigorous campaign next year against all unclean dairies in the State. 'Tis well. Let the good work go on.

Plans are matured for incorporating a poultry farm at Maywood, Tehama county. The New Era estimates that there will be one million chickens in Corning within the next five years. This means a daily revenue of $3,000 to $4,000.

The Santa Barbara Live Stock Association is discussing the advisability of endorsing the policy of the State Veterinarian in segregating certain districts in the county which are "clean" for the purpose of removing the quarantine.

One of the most important annual conventions of the State Creamery Operators and Butter Makers' Association of California was held in Modesto last week. Fifty delegates from different parts of the State answered the roll call.

The health officials of the city of Eureka, so it is said, have recently created considerable stir on account of the milk supply. A good many samples were taken and some of these were found to be drugged, and milk from tubercular cows was being supplied to the people.

The dairymen who are supplying San Francisco with milk are making a very good showing in opposition to the employment of the bacteriological test of milk, claiming that great injustice has been done them, as it is not the number, but the kind, of bacteria present in milk which determines its healthfulness.

A Marysville dispatch to Sacramento Union, Dec. 11, says: Hogs are profitable in Yuba County. Indeed, they are more profitable than horses or cattle in some instances. James McDowell of Sicard Flat does not raise hogs extensively, but two that were raised by him have just been sold, and he received for the dressed meat $69.12. They were 464 and 400 pounds respectively, and were but a year old. The price received was 8 cents a pound.

CLIMATE AND CROP SERVICE.

United States Department of Agriculture, Climate and Crop Bulletin of the Weather Bureau, California Section, for the week ending Monday, December 18th, 1905:

General Summary.—The weather continued cool and clear during the first part of the week in the central and northern sections and warm and clear in the south. Cloudy and unsettled weather prevailed toward the close of the week and light rain fell in nearly all sections on the 15th and 17th. Frosts occurred frequently, but caused no damage.

The cool weather and unusually light rainfall in the central and northern sections retarding farm work and the growth of early sown grain and pasturage. The soil has not been thoroughly saturated this season and is too dry for profitable cultivation. The outlook in the coast districts and in Southern California is very much better than in the great valleys. Grain is up and making fair growth and new range feed is in good condition, though needing rain in some places. Dry feed and hay are plentiful, but in most sections cattle are thin and in poor condition. Plowing and seeding continue in some places.

Northern California.—Cool and cloudy, with frosty mornings in the interior. Grass and grain made slow growth. Very little plowing; no seeding. Stock in poor condition.

Southern California.—Clear and warm weather continued most of the week, with light rain at the close. Frosts occurred in some sections, but caused no damage. The high winds at the close of the preceding week were confined to interior localities, no damage having been done in the coast districts. No definite reports of the damage to orchards in the interior have been received, but undoubtedly oranges and olives were considerably injured. Orange harvest is in progress and large quantities of oranges, olives and raisins are being shipped for the Christmas trade. Plowing and seeding are progressing and the acreage in grain will probably be larger than last year. Early sown grain and new grass are making fair growth.

LINERS

"THE CEMENT WORKERS HAND-BOOK" tells Farmers how to do all kinds cement work successfully; Walls, Floors, Walks, Tanks, Posts, etc. 30,000 words. Second edition. Cloth bound. Send 50c to W. HENRY BAKER, Wadsworth, Ohio.

FOR SALE—HENS AND CHICKENS AT Palms Station, Gardena.

C. H. SESSIONS, ASSOCIATE EDITOR

THINGS TO KNOW IN SWINE RAISING.

It has been said that for big money breed horses, for sure money eattle, for quick money hogs. Today we might eombine all three sayings in the latter, as the breeding and marketing of swine pays the general farmer better, surer and quicker than any of our domestie animals. Ameriea is pre-eminently the home of the hog of the future, as he is a logieal deduetion from Indian corn. When judiciously fed, there is no healthier food than eorn for hogs, and there is no better meat food than that whieh has for its foundation the corn of our eommon country.

In produeing the hog of the future, the signs of the times point to two important things very plainly, the honesty and integrity of the breeder and the individuality of the hog, both of which will receive greater and greater attention. From now on, the pig will be more of a faetor than the pedigree. Do not attaeh undue importance to popular strain, but pay especial regard to vigor of constitution, robustness and capacity for digestion and assimilation.

Among the objeetionable features to be guarded against are the slender, pipe-stem style of legs, slim, uneertain ankles and weak feet, with a failure to earry the meat of the ham full and well down toward the hoek. The strong, arched baek, the well sprung rib, the full heart girth, the broad shoulder and deep ham, the strong under-pinning the shapely foot—these are among the more vital points to be observed in building up a good and thoroughly useful herd of hogs.

Fig. 1—Good type of Poland Chinas

The good brood sow should be large and long, deep bodied, neat head, broad between the eyes, medium sized, flinty bones, with large heart girth. Select sows of the progeny of matured dams, that are kind mothers, prolifie and of quiet disposition. If a sow possesses these qualities and is a good breeder, keep her as long as you can. In selecting betweeu extremes, I would prefer the dam to be coarser and more rangy and tone this down with the sire.

In selecting a sire, he should be a thoroughbred of the same breed as the female, and a first-class individual. Do not let a few dollars stand in the way of gettin- a good animal. If possible, select him yourself. He should be more compact than the female, with very short head, broad between the eyes, and short, full neck, a strong, well-coupled baek, strong in the loin, with a well sprung rib and deep, full heart, short legs standing on short, strong feet. The top and bottom lines should be nearly parallel, exeept that the back may be slightly arched. Select the breed best adapted to your needs and tastes and stiek to it. This is the only way to keep up a high grade. Do not eross breeds. Sometimes a single outeross gives very satisfactory results, but I do not advise it. It is a good rule not to mate young sows before they are eight or nine months old.

I want to emphasize the advantage of having sows of the herd farrow as near the same time as possible. You will then be more inclined to give them eareful personal attention. Then, too, there is no more desirable feature in a buneh of shoats than uniformity. If the pigs are farrowed the same month and can be weaned about the same time, the sows all go to the field out of sight and hearing of the pigs, and the chanees are that the pigs will be better and fed more evenly than if weaned at different periods. A earload of even, eompact hogs will outsell a mixed earload.

Fig. 2—Standard type of Berkshires

The diffieult problem of management of farm stoek is to get frames for finishing. As an aid to this end alfalfa furnishes the cheapest material for perfect development of form and frame. It is nearly a perfect ration in itself, and should be the standby of the farmer. Indian corn is very convenient for hogs, but a variety of feed insures better health and better growth.

Fig. 3—Healthy Shoats in pasture

Pigs should be eating regularly and in sufficient quantities so there will be no checking of growth at weaning time. During the first four months of a pig's life do not feed too mueh corn. The secret in producing pork cheaply is to maintain a steady gain and higher degree of health and vigor from the very start. In the eorn belt, corn will always be the best and chief ration for maintaining hogs, but while they are growing feed them largely on grass, milk, roots and mill feed. Under all circumstances, give a variety of food, so as to keep up a keen appetite and produee a healthy and thrifty condition. No other domestie animal requires eloser or better attention than the hog, and no other animal will pay better for this attention.

Usc disinfectants freely about the premises. Lime, earbolic aeid or chloro-naptholeum are excellent. Keep all feeding floors and sleeping pens perfeetly clean. Tolerate no vermin in your herd by frequent use of kerosene emulsion. Keep hogs supplied at all times with pure water. This can easily be done by using some of the many automatie drinking founts now on the market.—F. H. Rankin.

In feeding stock, bear in mind that the cheapest feed is not that which costs the least, but rather that which gives the best results. All animals on the farm should not only be supplied with good food at all times, but also that which is adapted to the purpose for which the animal is kept.

Sheepmen should be satisfied and all stockmen encouraged to know that range lambs are selling at from $6.40 to almost $7, and that when sold lower, about 33 1-3 off these prices, for feeders it is for fully $1 per 100 higher than a year ago. Some leading stock commission houses freely predict that good feeders will range from 50 cents to $1 per hundred higher than they did last year for the entire season.

Col. J. M. C. Marble, Pres. E. E. Moore, V. P. and Gen'l. Mgr. J. E. Marble. J. E. Fishburn W. C. Marble, Secretary.

$201.00 in Prizes and 2 Silver Medals
WON ON BUTTER MADE FROM
GATHERED CREAM
SEPARATED BY
U. S. CREAM SEPARATORS

"Richmond, Quebec, Sept. 28, 1905.

I am pleased to advise you that my butter which was made from **gathered cream** at the Kingsey Creamery, of which I am proprietor, was **awarded $201.00 in Prizes** at the different Expositions of this season.

The first of these was the Sherbrooke Exposition, where I received the Eastern Townships Bank **Prize of $75.00** for the best exhibition of creamery butter, and also the **Medal** for the **highest score** in points.

At the Toronto Exposition I received **Two First Prizes** and **One Second Prize,** and tied with another Quebec Creamery for the **Silver Cup** offered for the highest score in points, with the result that we were both awarded a **Silver Medal,** also a **Diploma,** for the **highest score** instead of the Cup.

At the Ottawa Exhibition I received **One First Prize** and **One Second Prize.**

I also took the **First Prize** at both the Richmond and Drummond County Fairs.

Last year I was **awarded $112.00** in Prizes and a **Gold Medal.** I believe **this record cannot be equalled** by any other Creamery in this Province or in the Dominion of Canada, and think this speaks well for the quality of butter made from gathered cream, **90 per cent of which was separated by the farm sizes of United States Cream Separators.**

E. W. EVANS."

Sharples TUBULAR CREAM SEPARATORS

21 POUNDS MORE BUTTER PER WEEK

Barnesville, Ohio, June 20, 1905: We were milking ten cows May 19. That day we took a Tubular separator for trial. **We used it one week and got 86 pounds of butter that week. The week before** we used it, we got only 65 pounds. **The week after** the agent took it away we got only 64 pounds. We felt we ought to have it. Later we arranged to buy it. We recommend the Tubular to anyone interested in cows. It surely will pay any one to buy a Tubular.

SECURITY Stock Food

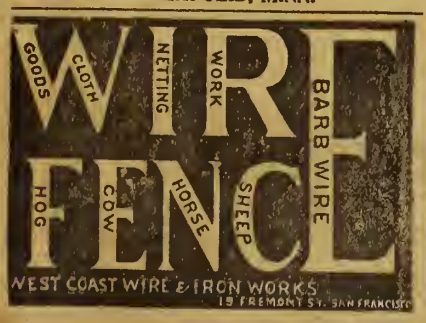
is sold on the honest plan of satisfaction or no cost. This is a straightforward plain talk and means just what it says.

Use **Security Stock Food** (glutenized) for growing animals; for fattening animals; for work horses; for milch cows. The Food won't cost you a cent if you can't see that **Security Stock Food** has saved feed, made quicker growth; kept your animals in better condition, given more milk, and made you more money. Write us if not satisfied and we will refund price in full. You are the sole judge. No questions asked.

For five years this guarantee has been on every package sold. It also covers Security Poultry Food, Lice Killer, Gall Cure, Colic Cure, Worm Powder, Calf Food, Heave Remedy, Healer and Rheumatic Liniment. Security preparations are sold by dealers in almost every town in the United States, who will recommend them highly and "back up" our guarantee.

SECURITY IS THE ONLY GLUTENIZED STOCK FOOD.

SECURITY STOCK FOOD CO.
MINNEAPOLIS, MINN.



YEARLY BUTTER FAT TESTS.

Editor Cultivator:

Herewith find clipping from the Jersey Bulletin. You see the authenticated butter fat estimate. Yearly tests are coming to the front. The only test that can be relied on as a sure indication of a cow's value for milk and butter. The Jersey Bulletin cracks up the seven-day tests. Why? Because there is money in it for their advertising bull calves from big seven-day test dams. The only test for business is the yearly test, as we have to feed and care for our cows the year round. It is not the cow that whoops it up for a little while that we are looking for for profit. It is the long distance one. Many of these cows that are able to make 14 pounds of butter in seven days will not show their 400 pounds of fat in one year. So the seven-day test is not a sure indication of a cow's true value as a butter producer.

This is not written for publication as I do not (in my position) care to crack up any kind of a test, but some of the talk in the Jersey Bulletin makes me tired—trying to discriminate against the Babcock test in favor of the churn. The Babcock tests give a cow credit for all the fat there is in her milk; no more, no less. What else does any one want to make butter out of?—C. S. Burgess.

"During the past week or ten days the American Jersey Cattle Club has received nineteen private butter tests, two authenticated fat estimates and one private fat estimate, all for the period of seven days. This is a good indication of the importance attached by Jersey breeders to the testing of their cows and to placing the tests on record where they will be permanently available for reference.

Private butter tests for a week or longer have always been encouraged by the A. J. C. club, and it is now a good many years since it began to publish those tests, fulfilling its requirements. At one time such tests seemed a sufficiently good demonstration of the performance of dairy cows. This is the case no longer, in the opinion of many experts and even in the opinion of the dairy public at large. The present desideratum is the test for a long period—a year or full lactation time—authenticated or guaranteed by some authority independent of the cow's owner. The A. J. C. C., as well as other breed associations, has made provision to meet this demand, the club even offering to pay one-half of the expense of authentication. No reflection can be considered to be cast by this action upon the credibility, or the desirability either, of the private test, which the club still continues to receive and publish. But it cannot be disputed that the year's test is the test to show the capability of the dairy cow, or that the test that is independently certified to is the kind of test that will carry most weight with the general public.

Many owners of pure bred dairy cattle fully realize this and they are taking up this line of demonstration with alacrity. In last week's Bulletin something was said in regard to Jersey breeders who are putting their cows on yearly tests. Our friends, the Guernsey breeders, had somewhat the start of the Jerseymen in this respect, and they certainly have not let the grass grow under their feet. Up to May last they had put on record 332 official tests for one year periods and had entered 271 cows and fifteen bulls in their Advanced Register.

At this rate, notwithstanding their far greater number, it would seem that Jersey breeders will have to do some hustling in order to overtake their Guernsey rivals."

A. Faught, a prominent rancher and sheep man living north of Santa Rosa, reports that dogs are playing havoc with his sheep. He states that dogs got into his pasture one night last week and killed 23 of his sheep and wounded 23 more.

GRAND
AUCTION SALE

The Finest Dairy Cows in the State. Do not miss this sale, as everything must go under the hammer. No reserve.

Thursday, Dec. 28th
At 9.30 A. M.

200 Head Cows and Horses
FARMING IMPLEMENTS

WHICH IS THE BEST MOTHER?

"Well begun is half done." Hatch chicks well either under a hen or in a good incubator and if the parents were vigorous, the young ones will be also. The natural tendency of a sturdy chick is to live, thrive and mature, and all we have to do is to encourage this tendency and help Nature in her work. The nearer we can come to Nature, the greater will be our success.

As there are three essentials in the production of eggs, so there are three in the raising of chicks, whether under a hen or in a brooder. These are comfort, proper food and exercise.

In our last chat we talked about comfort and decided that the chicks must not be crowded, but must have ample space and plenty of oxygen, or in other words, pure air warmed, but no drafts. Here is a great fault in many of the brooders, especially the hot water pipe or sectional brooders in use in many brooder houses and at one time so popular. I tried them for several years. The hot water pipes merely heat the air that is already in the hovers, which air is practically confined to the hovers by the felt curtain in front, provided to keep in the heat. It does that, but it also encloses the air which the chicks have to breathe over and over again. This defect in my brooders cost me the life of many chicks before I discovered the cause. when I changed to what is called the "individual" brooders.. Individual brooders make very satisfactory "artificial mothers," or foster mothers for chicks. They are called individual from each one being supplied with a separate lamp and being separated from each other. They may be used either indoors or out of doors according to the season of the year and the pattern of the brooder. For a home-made brooder I have found the one called the "Sanborn brooder," which I described some months ago in the Cultivator, most satisfactory. As a rule, in the early spring or in unsettled weather, it is wise to have these brooders under shelter, for while this is not absolutely necessary with a well constructed brooder, it is a great convenience to the attendant when caring for the machine and chicks, to be sheltered from inclement weather. Such shelters need not be expensive, and may afterwards be used as henneries.

With indoor brooders, a brooder house is very convenient. The advantages of such a house are, when the weather is stormy and wet the chicks have a comfortable shelter and will be busily engaged scratching in the litter on the floor of the house, happy and growing all the time, safe from inclement weather.

Individual brooders should have their floors well sanded and covered to a depth of an inch or more with some fine scratching litter to induce exercise and provide bedding. The litter should consist of finely cut dry clover or alfalfa hay, chaff or wheat straw. It should be cleaned regularly, the dirty litter and sand being replaced by clean material. A good rule is to clean once the first week, twice the second, three times the third, and daily thereafter. The brooder lamp should be cleaned and filled daily with the best oil. Good oil greatly lessens the risk of fires. The wick should be renewed frequently, at least once a month, so there will be no danger of the flame going out, or of irregularity in the heat, which comes from the use of an old wick.

The hover of the brooder should be aired and sunned daily, while the chicks are busy eating, for sunshine is the best natural disinfectant and health-giver. Careful attention to these little details will be well repaid in better results and better chicks. It is the little things that count.

* * *

In modern up-to-date brooders, with an excellent system of ventilation, there will be no trouble from lack of fresh air, for a supply of fresh air warmed to the right temperature in the heating chamber and then passes under the hover, supplying both heat and pure air at all times to the chicks. The individual brooder that I prefer, is divided into three chambers or parts, the warmest right under the hover, a little less warm just outside the hover, and beyond this the play room or exercise room, where the chicks scratch in the litter for their food and where they can be confined in stormy weather.

In many of the large broiler plants, hot water pipes are used successfully. These have pipes running the whole length of the building heated by means of a stove and coil, or a water tank heated by gasoline or distillate. The hovers are placed over the pipes, removed a few feet from the wall so the chicks will have a runway on each side of the hover and pipes. The runs and the floor under the pipes should be kept well sanded and have litter on them at least an inch deep. The pipes should be about three inches from the floor for the tiny chicks and should rise gradually until those at the end of the house are about six inches from the floor, or the floor should be lowered until it is six inches below the pipes. As the chicks grow they should be gradually moved along in the brooder house. The brooder house must be kept thoroughly ventilated but without a draft.

* * *

The temperature of the brooder under the hover should be from 90 to 95 degrees before the chicks are put in. It can be as cool as 90 on a sunny day, but on a cloudy day should be 95 degrees. The temperature under the hover should be gradually lowered from 90 degrees the first week to 85 the second, and 80 the third week. In a very short time one can judge by the actions of the chicks if the temperature is right. When it is warm enough they will spread out on the floor and they will not crowd together

Prize-Winning White Leghorn Cockerel.

The White Leghorn is a Mediterranean breed whose name was derived from the city of Leghorn in Italy. While they are small in size they are prolific layers. They are hardy, as a rule, and great rustlers. They are popular in California, where the climate seems to agree with them better than some heavier birds.

Petaluma Incubators and Brooders
The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the GOLD MEDAL at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?
St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.

And Now Comes New Reward for Merit:
Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

or huddle in a bunch, and they give a contented little chirrup when one looks in upon them at night. If they are too warm they give a little distressed cry as if complaining, and will often pant and hold their wings out. Of the two evils, overheating is the worst, but this rarely occurs in the brooders that have three compartments, each differing in heat. The temperature will at times grow colder during the night, so it is best to have it up to the desired height on retiring.

The brooder should be heated at least twelve hours before the chicks are put into it. The temperature under the hover should be 95. Keep the chicks in the incubator until they are from 24 to 48 hours old. A basket lined with flannel and covered with a blanket is the best thing for carrying the chicks to the brooder. I remove them carefully, counting them into the basket and covering them well with the blanket or shawl. Great care must be taken that they are not chilled on the way by letting the cold wind blow on them. Many chicks lose their lives by being chilled on this, their first journey.

The first few hours in the brooder they require no food, but clean, coarse sand to eat and water to drink. The sand supplies the little gizzards with the necessary teeth or little grindstones, so they are ready to commence work when the food comes. Water I place in a drinking fountain, so they cannot get into it and wet themselves. A convenient little fountain can be made out of a tomato can. Make a nail hole in the can about one inch from the open end, fill the can with water up to the nail hole, put a saucer over it and quickly invert the can. The water will leak out of the nail hole into the saucer very gradually as the chicks drink it up. Fountains on this plan can be bought at the poultry supply stores. I give the chicks a fountain of water and one of sweet skim milk from the first. Chicks will never over-drink if they have water always before them. If they over-drink it is a sure sign they have been too long without water.

We will talk about the proper food next week.

(To be Continued.)

* * *

EDITOR'S QUESTION BOX.

Bloody Eggs—Diphtheria.

Would you kindly let me know what is the reason of eggs being covered with blood? Many of my hens' eggs are just covered with blood. Do you think it is over feeding? I have about 130 chickens—Rocks and Minorca. I feed them bran in the morning and two 10-pound pails full of corn. In the evening I give them three 10-pound pails full of corn. They have free range on ten acres of alfalfa; grit, charcoal and lime always before them, and I give them boiled vegetables and meat.

(2) Have had hen which made a rattling noise first, then would try and crow. I cooped her up, discovered a hard, white substance covering her wind pipe; gave her germazone and coal oil, but she got worse and died. She just seemed to be strangling to death. Could you please tell me what ailed her. She seemed healthy otherwise. Her comb was very red and her liver was a bright red color. (Mrs. J. B. McD., Kern.)

Answer.—(1) When pullets, especially Minorcas, begin to lay the eggs are sometimes so large as to injure the egg duct and cause a small vein to bleed. This frequently happens when egg food or stimulants are fed to them. The remedy is more green food and a little Epsom salts in the water. But the trouble usually passes away in a few days without treatment. I do not think you are feeding too much.

(2) Your hen had either diptheritic roup or canker. They are very similar in appearance. For diptheria the best remedy is spraying with peroxide of hydrogen, and for canker highly paint the place with a solution of sulpho-carbonate of zinc. Two grains to the ounce of water. This will cure the canker of pigeons in one application.

* * *

Ducks and Turkeys—(H. A. S., Pasadena).

Kindly advise me in your next issue which is the most profitable all around duck, the Pekin or I. R.? Also if the White Holland turkey is as hardy as the Bronze, and which of these two mature quickest.

Answer.—This question about ducks is rather difficult to answer, because you do not state what you want the ducks for. Either market at eight weeks old or for eggs or for breeders. Nor your conditions, whether you grow the food or have to buy every thing.

Pekin ducks eat one-third more than Indian Runners and take about three months more to mature. but if you market either of them at eight or ten weeks it makes little difference. Indian Runners are very prolific layers of delicious eggs with a pure white shell, and having tried both kinds I decided there is more money in Indian Runners.

The White Holland turkeys are quite as easy to raise and as hardy as the Bronze, and mature as quickly. They are not as large. The young gobblers usually at Christmas weigh from 14 to 18 pounds, but they have smaller bones and very delicious juicy meat, and dress beautifully, not having dark feathers. They are the tamest and gentlest of turkeys, and do not wander, prefer roosting on a tree near the house, and bear confinement well. I have one beautiful White Holland hen turkey just in her prime—the last one. I wonder if anyone would like to trade me a young gobbler for her. It seems too bad to eat her.

* * *

MATING TURKEYS.

Editor Cultivator: Will you kindly inform me through the columns of your paper how many turkey hens can be kept with only one "tom turkey" to insure the eggs to hatch.—Mrs. J. W. J., Hanford, Cal.

Breeders differ as to the number of toms required. Some claiming that one male to fifteen females is sufficient and others that one to five is the right proportion. Depends upon the vigor and age of the tom.

* * *

CHICKS EATING FEET.

Editor Cultivator: What is cause and remedy of little chicks eating or pecking at each other's feet?—Subscriber, Haywards.

This is a frequent habit of little chicks. They want occupation and begin to play and having once tasted the blood in each others' feet a craving for it is developed and they become cannibals. The remedy is to give them occupation and more animal food. By scattering their grain in chaff or chopped alfalfa they will scratch in it and so find ocupation. There is nothing like employment to keep chicks and other bipeds out of mischief.

POULTRY FOR MARKET.

All who grow and sell poultry of any kind, as dressed poultry, should learn to dry-pick them at home. When prepared in this way, they are much more attractive or presentable for the purpose intended than when sold alive or scalded and picked. Dry-picked poultry of all kinds, including geese, ducks, turkeys and squabs, if of good quality, sell for better prices in the open market than they will if scalded. For home use or quick consumption, scalding will answer the purpose, but when sent any distance, or if to be kept for any length of time, dry-picking is by far the best.

When picked for shipping, if to go but a short distance, in cold weather, wrap each fowl separately in clean white or manila paper and pack close and firm in a clean box, barrel or keg. Never use soiled or printed paper for this purpose. Always use clean packages of whatever kind you may select. Dirty or unattractive packing or packings count against the value of the shipment. A mixed lot of good, medium or inferior quality usually sell at the value of the poorest of the whole lot. Careful grading of the shipment, as well as neat dressing and

Sending a Train Load of Coulson's Poultry Foods Down in Central California, San Joaquin Valley

Scene at Petaluma Freight Depot—Sending a train load of 12 full cars loaded with Coulson's Egg Food and Coulson's Special Chick Feed down into Central California.

A. R. Coulson, president and manager of the Coulson Poultry & Stock Food Co., has this year traveled all over the state of California in the company's automobile. The following is a clipping from the Petaluma Argus:

"MADE AN AUTOMOBILE TRIP TO MEXICO.

"A. R. Coulson returned Sunday afternoon from San Francisco. He arrived in the metropolis from Mexico, after an absence of ten weeks. He reports a fine trip. During his long trip he did not have an accident with the automobile. Mr. Coulson is the first person who has driven from San Francisco to Mexico in an auto, the distance being about 2000 miles. The auto will arrive tonight from San Francisco."

About April 10th, Mr. Coulson accompanied by one of the salesmen, started on their long automobile trip. On their trip down along the coast, from San Francisco to San Diego, they took orders for over 500 tons of Coulson's Egg and Chick Feeds, about 35 carloads. Afterward, in the month of July, another 100 tons was sold in Humboldt County, and on their trip through Napa and Solano counties, another 100 tons was sold. In September, on their trip from Sacramento to Redding, up the Northern Sacramento valley, seven more carloads, and on the last trip in October, Mr. Coulson, accompanied by Mr. J. M. Bull, sold twelve carloads more in the San Joaquin Valley, as follows:

Simon Newman Co., at Newman, 1 car; Dos Palos Colony, Rochdale, Assn., 1 car; Moore Plate Co., Madera, 1 car; Fresno Rochdale Co., 2 cars; Kutner, Goldstein Co., Selma, 1 car; Kutner, Goldstein Co., Hanford, 1 car; Linder Hardware Co., Tulare, 1 car; H. Frame and the Rochdale Co., at Porterville, 1 carload; Goldstein & Iseman, Visalia, 1 car; Burum & Burum, Dinuba, 1 car, not less than 15 tons in a car.

Each of the 70 firms that handle Coulson's Foods in carload lots, wholesale it to a number of other stores, so that there are probably 600 or 700 stores on the coast that sell Coulson's Egg Food and Coulson's Chick Feed, so that you should be able to get Coulson's poultry foods at some store in every town.

Mr. Coulson visited nearly every poultry raiser or farmer that raises poultry, having talked with over 5000 of them this summer, and it was always noticeable, that where the poultry was fed on Coulson's Foods, the fowls had such bright red combs (showing healthy liver). Their plumage was even and glossy, they were spry, active and healthy, and the owners were satisfied that feeding Coulson's Balanced Rations was far better than ordinary grain feeds.

Mr. Coulson believes in small profits and large sales. He also believes that the best of everything is the cheapest in the end. Consequently, only the best grade of feed and ingredients is used in preparing Coulson's Feeds.

There are many firms that imitate Coulson's Poultry Foods, and which they offer at a cheaper price, but they do not contain as many of the expensive and result-getting articles. In spite of all the cheaper imitation foods offered, there is undoubtedly more of the Coulson's Food sold, than all others combined.

You will never know how good COULSON'S POULTRY FOODS are until you see some of the imitations.

A. R. COULSON,

President and General Manager of Coulson Poultry & Stock Food Co., now incorporated at $100,000, and soon to be increased to $150,000.

So when you buy a chicken ranch, the first thing you want to do, is to find out where you can buy COULSON'S FOODS, for chickens are like machines, and if you treat them right, and feed them on COULSON'S FOODS, they will make money for you.

THE COULSON COMPANY'S AUTOMOBILE.

With which Mr. Coulson this year traveled all over the state of California on business.

One poultryman at Hanford has a flock of 350 hens, and for over a year they have been fed on COULSON'S EGG FOOD. At present, these hens are laying two cases of eggs per week, which are sold at Berkeley for 50c per dozen. The cost of feeding these hens Coulson's Egg Food is less than $4.00 per week. Amount received for eggs, $30.00 per week.

Another large poultryman near Petaluma has 3200 laying hens, which have been fed on COULSON'S EGG FOOD for the past three years. They are fed two sacks of Coulson's feed a day, and they are laying now 1200 eggs a day, which means 600 eggs from one sack of Coulson's Egg Food, or $20.00 worth of eggs from less than $2.00 worth of feed. You could afford to feed your hens Coulson's Egg Food and make a profit even if it cost twice as much as it does.

READER, YOU SHOULD FEED YOUR HENS COULSON'S EGG FOOD EVERY DAY.

They need it in their business.

Coulson's Egg Food is a rich feed, composed of about three-fourths ground grains or mill feeds, and one-fourth of extras, like Dried Blood, Cooked Meat, Fresh Ground Bone Meal, and other things, all thoroughly mixed, ready to feed the chickens and make them lay.

Ask your dealer about it.

COULSON'S EGG FOOD For Hen.

COULSON'S SPECIAL DRY CHICK FEED for little chicks.

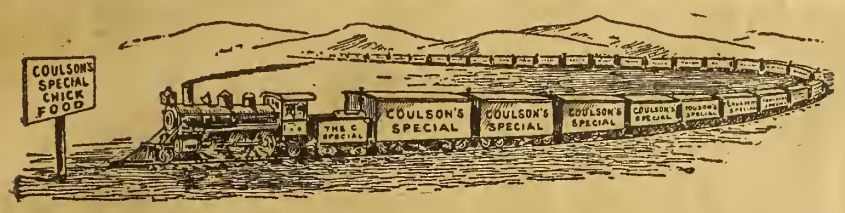
Manufactured by

Coulson Poultry & Stock Food Co.

Petaluma, California

Nothing Succeeds Like Success

325 car oads of Coulson's Poultry Foods (Coulson's Egg Food and Chick Feeds) sold in California during the year 1905. Enough to make a solid train load two and one-half miles long requiring 20 engines to pull it. Over 125 carloads shipped by steamer.



BALANCED FEED RATIONS

Intelligent feeding of Poultry and Stock is the one way to make it pay. You have heard that some foods furnish fats, other foods make muscle and tissue, and others make bone, shell, etc. You know that most foods contain one or more of these elements, but no feed would contain them all in the proper proportions.

Now, by understanding the different values of different feeds, is where the secret of success comes in. The Coulson Poultry & Stock Food Co. makes a specialty of the feeding problem. Under the care and instructions of A. R. COULSON, the Chicken Doctor, they prepare special mixed feeds, or properly "balanced" rations for poultry, which are mixed with the right ingredients, in the right proportions to make poultry pay.

First, they make a Special Chick Feed for feeding baby chicks. It is composed of tiny pieces of cracked grains, specially selected small seeds, baked hearts in meal, pin-head size, Steel Cut Oat Meal, Millet Seed, and other things, each in the right proportion to keep the little chicks healthy and make them grow.

The COULSON POULTRY & STOCK FOOD CO., occupying a building 70 by 120 feet, and also several smaller buildings on the property at 730-736 Main street, Petaluma, employing about thirty hands, are engaged in the mixing of the various feed stuffs, animal meals, beef scraps, dried blood, ground bone, seeds, etc., into the best properly balanced mixed feeds, especially adapted for certain results.

The materials are brought in large quantities from all parts of the world. Mill Feeds from Washington and Oregon and various parts of California, Oat Meal in carload lots from Illinois and Kansas, Millet Seed in carload lots from Minnesota, some from Germany, Hemp from Germany, Canary Bird Seed, some imported, Peppers from Japan, Rice from China and Japan, Flaxseed from Oregon, Ginger from Africa and Japan, Corn from Nebraska, etc.

$100,000

PAID TO THE ARMOUR PACKING CO.

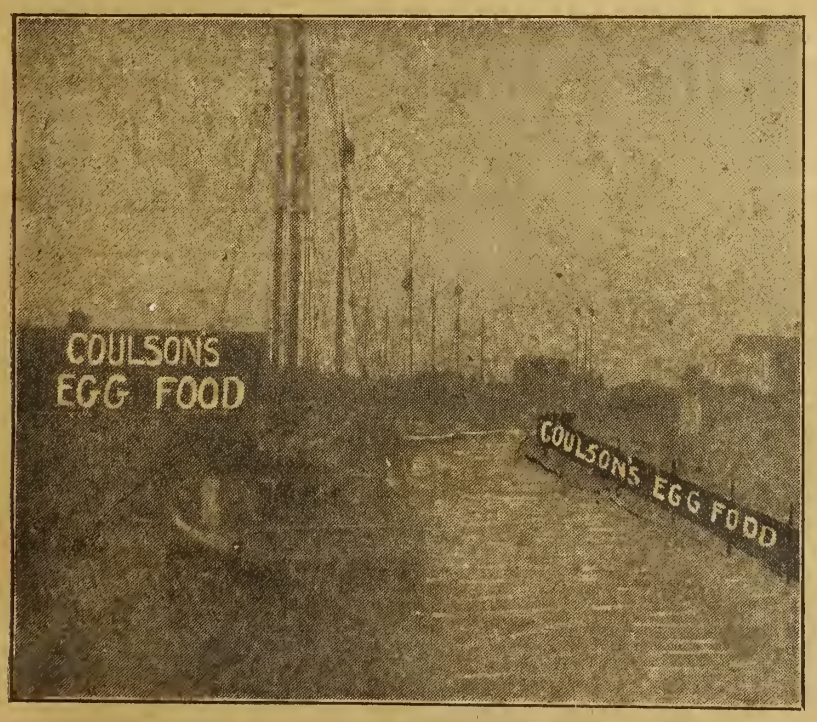
For our Animal Meals, which includes Dried Blood Meal, Meat Meals, Beef Scraps, etc., which enter into our Poultry Foods and other balanced rations, we have an annual contract with the Armour Co., with their vast works at Chicago, Kansas City, and South Omaha, employing in all, an army of 25,000 people. By this contract we have the exclusive sale for the Pacific Coast of their goods in our line.

This Meat Meal is made from **Hearts** and **Livers,** which are kept separate from all the rest, for our own trade. After being thoroughly cooked, they are dried, then ground and screened into different sizes and sacked, and shipped to us in carloads of 20 to 50 tons.

The Bone Meal, Animal Charcoal, etc., (made from fresh ground bones only), are prepared for us at San Francisco, by the largest concern of the kind on the coast, giving us the benefit of the latest improvements in machinery and methods of preparations. In the process of manufacture of Bone Charcoal Bone Meal, etc, great care is exercised that none are lost.

All these ingredients are mixed together in proper proportions, all ready to feed to the chickens.

If you are interested in poultry, send us 4 cents to pay postage on our 80-page Catalogue and Poultry Account Book free.



Schooners Bringing Food to and From Petaluma Where Coulson's Egg Food is Made.

SEVENTY DIFFERENT FIRMS IN CALIFORNIA BUY COULSON'S POULTRY FOODS IN FULL CARLOAD LOTS.

The following dealers purchase COULSON'S FOODS in full carloads lots, thus getting the benefit of special car freight rates; therefore they are able to sell COULSON'S POULTRY FOODS at lowest prices:

MAKING HENS LAY.

It has been demonstrated beyond a question of a doubt that hens can be made to lay from two to three times the usual number of eggs. Experiments have been made on fowls for a number of years and a food developed that is absolutely certain to make hens lay. It is no wonder worker and won't do this in a day or even in a week, but any flock of hens can be put in condition in from two to four weeks; the time depending on the care they are receiving, feed, age, and whether they are just beginning to molt, at present molting, or through molting. It has been proven time and time again that within a month's time a flock of hens can be put in paying condition and show a handsome profit over the cost. In fact, the Security Stock Food Co. absolutely guarantees to make hens lay and their product is sold on a broad and liberal guarantee stating that if you are not absolutely satisfied, no matter from what cause, your money will be refunded. They take all the risk and it is well worth a trial under these conditions.

EGG-EATING HENS.

It is not natural for a hen to eat eggs, though when once she becomes converted to the delicacy she never forgets it until a change of condition occurs, but she may be so situated as to be unable to eat them. The best method is to make a nest out of a soap box, one end of the box being open, so as to compel her to walk into the nest. The box should be raised a sufficient height from the floor so that she will be unable to reach the eggs in the nest from the ground. The nest box should not be too large. The hen will go on the nest, but her body will protect the egg, so she will not have room to peck them. Egg-eating sometimes is cured by filling egg shells with mustard paste, which makes the work disagreeable. The best way is to allow no eggs to become broken in the nest. If the hens are not brought in contact with eggs that are broken they will never learn to eat them. Fresh egg shells should never be thrown to the fowls, as a hen that learns to eat eggs will set an example to the others, and as one of them may begin on egg shells it is better to avoid feeding them to the flock.

Snuffles, or running at the nose, is found in most flocks and is only the effects of a cold. The nostrils will be encrusted with matter producing the snuffling sound. If caused by exposure, remove the cause by keeping the fowls warm and wash the nostrils with castile soap and water. Feed soft food, and usually they will come out all right.

Giddiness in fowls usually indicates too much fat and blood. The chief symptoms are twisting the head, carrying it on one side, going around in circles, running against objects, etc. The remedy is to hold the fowl's head under a stream of cold water for a short time. Give them a dose of Epsom salts and feed lightly for a few days.

This is the time of year to see that your chicken houses are in good shape for the cool weather that is sure to come before long.

CUT UP SCRAPS.

Do not feed table scraps in chunks, but cut them up into small bits of a size suitable for a hen to swallow. Then each hen will have a chance to obtain its share at the feeding trough. If given as they are gathered from the table, the more masterful hens will secure the largest pieces and make good their right to their possession. The others must be content with their leavings, and the consequence is that some of the hens will have a very light breakfast. Feeding, which permits some hens to be gorged, and others left with half a meal, is bad feeding. The plan is particularly bad in feeding table-scraps, as harmful results are sure to follow the habitual eating of this kind of food to the point of stuffing. Feed table-scraps only once a day, preferably in the morning, and then reduce them to a form that will insure even distribution to all the flock. Do not feed scraps in quantity which will cause the hens to turn away from the troughs with bulging crops, for you can feed them too much of this rich kind of food.

SCALY LEGS.

Observe the legs of your young chickens and see if they show any signs of scaly-legs. This is a troublesome diesase to get rid of when it has become thoroughly established in a chicken yard, but it is easily overcome at the beginning. Anoint the legs with lard or kerosene oil, mixed with a few drops of carbolic acid. Repeat the treatment once a week until all signs of the disease disappears. It is a tedious operation but it must be gone through with if the fowl are to be saved from this ugly disfigurement. If the disease was present in the house last year, and this is now occupied by your young stock, the latter are sure to become affected, unless in the meantime the house has been thoroughly cleaned and renovated.

Scaly-leg does not injure the fowl, otherwise than spoiling its appearance. If the fowls are to go on exhibition, however, it militates against them considerably and will lower their value even if sold for market. But there is no excuse for its continuance in stock, for it is one of the diseases which is preventable.

Queries and Suggestions

MUSHROOMS.

Editor Cultivator—I am very much interested in growing mushrooms and mean to give it a fair trial. I saw in your paper where they had been successfully grown as an experiment.

1. How shall I make my beds?
2. Where can I get the spawn?
3. When is the best time for mushrooms?
4. What is the market price?

I hope I am not asking too much, and will await a speedy reply.—Mrs. M. E. R., Santa Barbara.

Though the growing of mushrooms has rapidly increased during the past five years, very few houses have yet been built for that sole purpose in this country, the supply still coming largely from beds formed under the benches of greenhouses, in cellars and outbuildings, or other odd corners. As the mushroom grows best in darkness, the essential conditions of culture being a friable soil full of fermenting vegetable matter, moderate moisture and a steady temperature between 50 and 65 degrees—it is apparent that an excavation in the soil of the proper form and size, covered with a tight roof, will best meet the requirements. Probably the least expensive form of mushroom house is modeled after the ordinary "even-span greenhouse, substituting a board and paper, or shingle roof in place of glass or sash.

The material used for making beds must contain nitrogen in the form of a nitrate, or salt formed by the union of nitric acid with a base, as in a form of ammonia. The material used may be fresh manure from horse stables, with soil or well rotted manure mixed together in proportions in accord with the system of culture adopted. The general system, in use by many, of mixing material, is fatal to a good, all-round crop, as the bed formed under the old system has a very complex service to render. First, it is the home of the spawn; second, it must furnish the necessary warmth for a healthy and free growth of spawn; third, it must supply the general food for the mushroom's development. So there can be no doubt that if any of these conditions fail, a food crop cannot be gathered. The material may be two-thirds fresh manure with the straw left in, soil and well rotted manure, well mixed together and put down in layers. In using soil,care must be taken to half lift and shake slightly the material, so as to let the soil filter down through the straw; this will prevent burning or drying out, and the bed will need less water. The fermentation will be slight and the decomposition of the mass slow, which is one of the chief features of keeping up a constant supply of food for mushrooms. Keep adding layers until you have a depth of two feet or more. The material should be kept pressed down until it becomes firm only, and the bed will be ready in a few days to spawn.

Make mushroom beds early in September, bearing in mind that the best results come from a slow and long fermentation. Beds that dry or burn out do not pay. Make no beds less than fourteen inches in depth when packed down.

If growing in pits, the first operation is to dig out a trench five feet wide and fourteen to sixteen inches deep in center, sloping down banks to center. Mix manure and soil together and form a bed in trench, high enough when completed to be nine inches above ground level when well tramped down. Now take 3x4s and form rafters for a span roof, allowing the north side rafter to be eight inches longer than on the south, so as to overlap. Take the boards and place them lengthwise, overlapping, like a shingle roof, to turn water. The north side boards may be nailed fast and the south left movable, leaving on south side six inches of space at top for ventilation, where the overlapping roof keeps weather out.

The only attention the bed will need is a slight watering when the crop is cutting; and the pit should be covered with short litter or long manure to keep off sun. Such a bed may be used more than one year; several years by adding four inches of new soil and manure which has been in compost, spreading evenly over the surface of the bed. The beds should not be allowed to get water soaked, and ground must be graded to turn all surface water.

The conditions suitable to mushrooms are moist to a perceptable degree, the surface soil kept damp at all times, watering moderately with clean water of 80 degrees temperature. Anyone having space outside can raise good mushrooms in this way with little expense for material, labor, etc.

The market price at present is very high, good mushrooms retailing for 50 cents per pound. The spawn may be procured from any seed house advertising in our columns.

DIARRHOEA IN CALVES.

Editor Cultivator.—Will you tell me what is the matter with my calves? When they are from twelve to twenty-four hours old they take the scours and die in a few hours. The cows run in the stubble field where I cut oat hay this season. There is no green grass. They are fed oat and wheat hay (very little wheat), and bran is mixed with the hay after it is cut through a feed cutter, then dampened. They have good well water and all the salt they will eat. Please answer through Cultivator.—G. W. D., Santa Rosa.

Your cows are propably eating the rust on stubble known as Tilletia Caries, which grows chiefly on wheat and may be found with bran or meal. It causes diarrhoea and in weak stomachs may result fatally. Your calves doubtless receive this poison from the cows. Use remedies heretofore given in these columns. A raw egg three times a day will tend to heal the stomach and intestinal organs.

CURE OF COUGH OR HEAVES.

Editor Cultivator.—Mr. T. A. Smith of Azusa suggests for the good of Cultivator readers a sure cure for a horse cough or even heaves in mild cases. It is a table spoonful of ginger with grain from one to three times a day, owing to severity of the case. Cures should be effected in from two days to a week.—H. G., Los Angeles.

EGG PLANT.

Editor Cultivator.—Can you tell me what is the cause of my egg plant not growing larger than sample? (Sample not sent.—Ed.) Are they perennials or annuals? Do they bear fruit first year if perennials?

They have good rich soil which produced choicest of other garden vegetables, such as cabbage, lettuce, beets, peas, beans, corn and tomatoes. This is my first experiment with the plant, and should like to learn more of it.—Mrs. F. K., Smith Creek.

Egg plants need a warm location, plenty of water, yet good drainage, and good cultivation so that at no period the growth is checked. They often set too many fruits which must be pinched off if larged sized fruits are desired. The plants should also be pinched back occasionally to keep them compact and well balanced.

WALNUTS FOR SALE.

Editor Cultivator.—I have about 1,200 pounds of No. 1 softshell walnuts, unbleached, I would like to sell. I see you quote them at 14½ cents. Please inform me where I can get 12 cents. Will deliver them in Los Angeles at that price.—W. N. P.

Write Percy R. Wilding & Co., Los Angeles.

SWEET POTATO PIE.

Editor Cultivator.—Can you give me the formula for making a sweet potato pie?—A. S. H., Pomona.

After boiling potatoes until thoroughly cooked, strain through fine sieve and make same as pumpkin pie.

Milking Goat.

Editor Cultivator: Will you kindly give directions for the care and feeding of a milk goat? And oblige.—A. E. W., Pasadena.

Answer.—Feed the goat on rations of alfalfa and barley hay with a little barley grain. Oats are better for milk. Do not over feed at any time. The goat to do well should always be allowed to run considerably. Water the same as a cow.

DYNAMITE IN TREE PLANTING.

The most practical way to prepare a site for planting fruit or ornamental trees on heavy clay, hard, dry or even wet, soggy soils, is by the use of a small charge of dynamite for each tree. I have practiced this method for a number of years with grand success at an expense not to exceed ten cents for each tree.

I began by shoveling away the earth where the tree is to be planted, from a space of 3 to 5 feet in diameter, and from 10 to 20 inches deep, or until I reach the hardpan or drv. hard earth. In center of this excavation I make a hole about two feet deep, with a crowbar or post auger. At the bottom of this I place a small portion of a stick of dynamite, to which is attached a cap and fuse. I tamp clay in firmly above the dynamite and set off the charge.

The explosion will loosen and shatter the most compact clay bed or dry hard substance that underlies any soil from five to ten feet in diameter, the depth of course depending upon the amount of dynamite used. In ordinary cases two to four ounces is sufficient to make a splendid tree bed. It does not throw the soil completely out, but loosens and mellows it so the roots and the moisture will penetrate to a greater depth.—A. D. B.

If You Knew You Could Double Your Crop and Enhance Its Quality by Securing Plump, Fertile and Sure-Growing Seed, You would Do It Immediately.

If you will favor us with an order for any of the following sure-growing vegetable seeds, which we are offering at prices within the reach of all, your hope will be realized:

ONIONS—Prize-Taker. Pkt, 5c; oz. 10c; 1-4 lb, 40; lb, $1.35.
LETTUCE—Curled Simpson. Pkt, 5c; oz, 10c; 1-4 lb, 25c; lb, 75c.
CABBAGE—Extra Early Eureka. Pkt, 5c; oz, 10c; 1-4 lb, 35c; lb, $1.25.
BEETS—Improved Blood Red. Pkt, 5c; oz, 10c; 1-4 lb, 20c; lb, 50c.
CARROTS—Ox Heart. Pkt, 5c; oz, 10c; 1-4 lb, 20c; lb, 50.

If you plant these seeds you will get results in bounteous crops which will prove a pleasure and a profit.

A PSALM OF FARM LIFE

Tell me not in broken measures
  Modern farming does not pay
For the farm produces chickens,
  And the hens—do they not lay?
Eggs are high and going higher,
  And the price is souring fast;
Every time we go to market
  It is higher than the last.
Not a coop but it produces
  Every day an egg or two;
So each farmer gains his million,
  Even though his hens be few.
Every egg is very precious,
  And the hens are held in awe;
When a hen begins to cackle,
  Then the farmer goes "Haw, haw!"
In the broad and busy farmyard
  Struts a rooster now and then,
But the shrewd, be-whiskered farmer
  Only notices the hen.
Trust no rooster, howe'er showy
  Be the feathers in his tail;
Pay attention to the biddies
  And your wealth will never fail.
Lives of farmers all remind us
  We may roll in wealth some day,
If we hustle to the market
  With the eggs our pullets lay.

—Chicago Chronicle.

The Widow and the Boy

"Love," said the widow sententiously, "is like a generous wine—both are delightful if taken in moderate quantities, but in each an excessive indulgence will produce the same disastrous after-effects."

"Ah," said the boy, regarding her thoughtfully, "the parallel is, no doubt, good, but I fancy I have heard something like it before."

"That," said the widow, with a pretty little pout, "is the disadvantage of living after Selwyn, Walpole and Sheridan. There are no good things left to say. Epigrams are no longer spoken—they are carefully collected, indexed and entered into notebooks by novelists, to be served up retail by them afterward at so many epigrams per page in their novels."

The boy continued for an instant longer to regard the widow with something of a critical air. The result of his survey confirmed him in the conviction that she was quite the most beautiful woman he had ever seen. It was, therefore, with an almost startling precocity of discernment that he remarked after the last little pause:

"How clever you are!"

The widow, for all her worldliness (and she prided herself a good deal upon this) colored with gratification at this artless tribute to her intellectual charms.

"Do you think so?" she said.

"Adorably clever," he replied. "And I," he added, with a singular lack of justice, " and I am so stupid."

"No," said the widow, in the judicial tone of one balancing evidence, as she looked at the boy over the edge of her fan. "I don't think you are stupid—I should not call you stupid in the least. Most young men—very young men—are simply appallingly stupid, but you are really an exception to the rule. You don't, for example, try to talk and say clever things, and, of course, fail ignominiously. You are content to listen, and when you hear clever things said—by others—you can appreciate them."

"Only when they are said by you," corrected the boy, bending a little toward her.

"That's rather nice," said the widow, critically.

The boy smiled to himself.

"How would you recommend it to be taken?" he asked, after another little pause, during which the dance music from the ballroom in the distance floated to their ears with a pleasantly subdued sound that harmonized well enough with the subdued light of the conservatory and the confidentially subdued tone of their conversation.

The widow, whose thoughts at that instant were divided between the invention of a fresh epigram and the undeniably handsome profile of the boy, roused herself with a little start.

"Taken," she repeated, fixing her large blue eyes on the boy's face in mute interrogation. "Recommend what to be taken?"

"We were speaking just now," said the boy, "or rather you were, of a certain generous wine, or was it something else?"

The widow laughed—another of those little, low laughs which seemed to the boy indefinitely more musical than the strains of the band in the ballroom.

"I don't think," she said slowly, "I don't think I should recommend it to be taken—at all."

"Ah," murmured the Boy, "that generous wine! And why not?"

"There are always the after effects, you see," mused the Widow dreamily."

"If taken in immoderate quantities," observed the boy. "I think that was what you said?"

"It is so difficult," explained the Widow, "to confine oneself always to—moderation. The young man and untried palate——"

"Yes," said the Boy as she paused.

"Is easily overcome. Love is a powerful intoxicant."

"Like the nectar of the gods!" sighed the Boy. "But to gain heaven——"

"Remember the after effects!" interrupted the Widow, warningly.

"I was going to say it were worth risking them," he concluded.

"Perhaps—yes, perhaps," murmured the widow, stealing another glance at the boy's face.

"And you—you, too, would run that risk?" he asked, with sudden emphasis.

The widow sank back into the cushions of her chair. For a widow—and a worldly widow, her heart had begun to beat strangely fast. Still, she did not forget that she was a widow—nor the didactic obligations attaching to that role.

"I?" Her laugh had something of nervousness in it. "Oh, no, I am too old for experiments in new sensations!"

"You forgot, too," she went on hurridly, "that I am a widow—and, therefore a dangerous person to—to suggest experiments of this kind to! Do you not remember Mr. Weller's excellent advice on the subject of—widows?"

"Yes," said the boy, camly. "And I agree with it. Widows are a perpetual menance to the peace of man. That is why I want to remove you from that pernicious sphere of influence in the future."

"To remove me from——" The widow stared at the boy in momentary bewilderment, and then she caught her breath by the effort to give a little laugh, which ended in an odd little hiccough instead.

"Then you admit," cried the boy triumphantly, "that it would be a new sensation?"

"You jump to conclusions too quickly," was the best rejoiner she could find to make; and the weakness of it was patent, even to the boy.

The relative positions of herself and the boy seemed somehow changed during the last three minutes, and she was fast losing her grip of that sense of mental and worldly superiority that had hitherto sustained her in her didactic attitude toward him. In a desperate attempt to regain her lost prestige she took refuge behind another epigram.

"The very young man is often bold from mere ignorance," she remarked, sagely.

"Then you shall teach me to be timid!" he rejoined, with disconcerting aptitude.

The widow realized that the position was no longer tenable. She sought for a means of escape that might yet enable her to effect a compromise with her self esteem. But the boy pressed his advantage home.

"I swear," he went on, passionately, "that I will learn that lesson from no other teacher—that I could learn it from no sweeter one!"

"You are so young—so very young," she faltered, "to learn."

"Young!" The boy uttered a joyful laugh. "Yes—I am young—but that is no crime in love, whatever it may be in politics! Or, at least," he added, "if it is, we are fellow criminals—you and I!"

"I am much older than you," said the widow, with dignity, and quite ignoring the implication in the boy's last words.

"How old are you?" the boy demanded, gazing at her unwinkingly.

"Don't look at me like that, please! * * * I am 23, since you are impertinent enough to ask me my age!" she retorted.

"And I," he replied, "am 22."

"I? Really, you are——! Well * * * "Really," exclaimed the widow, opening her eyes upon the boy in wonder. "I should never have put you down at more than 20."

"Fact!" said the boy. "Twenty-two. Not much in it, after all, is there?" he added, with cheerful candor.

"Age," said the widow, loftily, "is to be measured by experience—not years."

The aphorism restored her to a momentary sense of intellectual superiority once more. The boy conceded it with a shrug of well-simulated despair.

" * * * To be both clever and beautiful!" he murmured. "And," he added, after an instant's pause, while his eyes dwelt upon the widow with unmistakable admiration, "so young."

"Young!" exclaimed the widow, drawing herself up.

"It is only the young," he observed, "the very young, who can afford to pretend to be old! You are young enough to pretend to be, Sarah—but" (he leaned over so that his face was very close to hers) "you are too young to be allowed to remain a widow!"

"And who is to prevent me , pray?" she demanded, with a fine showing of independence.

"By your leave—myself," answered the boy, suddenly seizing her disengaged hand and drawing her toward him.

The struggle was a brief one. Before physical predominance, mere mental supremacy and an excess of worldly experience are powerless. The widow recognized this.

"And I thought," she murmured, extricating herself with what dignity she could, that you were only a boy!"

"I was—yesterday," the boy admitted; but now——"

"Now," she put in gently, "you are older—much older and wiser than I am."

"Yet not too wise to learn love's lesson from you," he protested, gallantly. "It is from your lips, sweet, that I shall drink that generous wine—and so gain Heaven!"

"Our dance, I believe," said a courteously deprecating voice at their elbow.

The widow and the boy turned simultaneously with a guilty start. A man stood patiently in the background absorbed in the examination of his program.

The widow uttered a stifled exclamation.

The boy raised his eyebrows.

Then they looked at each other and smiled.—Percy Yeavett, in Denver News.

SIGNIFICANCE OF ORANGE BLOSSOMS.

"Authorities speak of the use of orange blossoms at weddings as due to the fact that the orange tree, bearing its ripe, golden fruit, is a symbol of fruitfulness; and this, we may take it, is the main reason of the pleasing custom.

In Crete, the bride and bridegroom are sprinkled with orange flower water; and in Sardinia, oranges are attached to the horns of the oxen which draw the nuptial carriage. Dr. Brewer says that Saracen brides carried orange blossoms at weddings, and suggests that our modern custom is a survival, or revival, of theirs.

In "Vanity Fair" Thackery speaks of orange blossoms as "touching emblems of female purity imported by us from France. This happy thought, however, is merely a fancy of his, for orange blossoms, according to French scholars and writers, simply indicate that "mademoiselle" has attained the status of "madame."

Cookery Recipes

MENU FOR SUNDAY DINNER.

The following will make a fine town or country dinner:

Cream of tomato soup.
Bread sticks. Celery.
Smothered chicken.
Mashed potatoes. Creamed parsnips.
Lettuce salad.
Wafers. Cream cheese.
Ice cream. Macaroni.
Salted almonds.
Coffee.

* * *

Squabs and pigeons.

Panned Squabs—Split the squabs through the back and breast, spread with melted butter, and set in a hot oven for ten minutes. If not browned enough put for a minute or two into the broiler. Serve on buttered toast slightly moistened, and pour over them the drippings from the pan.

* * *

To boil squabs—Dress like broiled chickens, split down the back, pound flat with rolling pin, butter the broiler, and cook over coals or gas until a delicate brown. Turn them often. When done sprinkle with salt and pepper and spread with butter.

* * *

To broil pigeons—Put the pigeons in a kettle that will crowd them slightlv, so that it will not take a large quantity of water to cover them. Cover tight and boil slowly until there is only half a teacup of water left in the kettle. If it is a flaring granite saucepan, in which the sides brown slightly over the gas, so much the better. Spread the birds with butter and brown them on the broiler. Serve on buttered toast and pour over them the drippings from the pan.

* * *

Potted pigeon—Truss the pigeons, put them into a baking pan and run them into a hot oven to brown. While they are browning make a sauce of butter and flour rubbed together and thinned with stock. Stir this until boiling, and add a little onion, chopped parsley and a dash of kitchen bouquet. Put the pigeons in a sauce pan, cover with the sauce, and cook slowly for an hour and a half.

* * *

Roast pigeon—Wipe dry and spread a lump of butter on a bit of bread and put in the cavity of each bird. Cover the bottom of the baking pan with thin slices of pork and put the pigeons in, trusses and with the back down. Put a little water in the pan, baste often, and roast a light brown. It will take from twenty to thirty minutes. Make a gravy from the drippings in the pan, and just before sending the pigeons to the table garnish them with bits of salt pork and squeeze the juice of a lemon over them.

* * *

Baked squabs—Sprinkle the squabs with salt and pepper. Melt a tablespoonful of butter in the bottom of a roasting pan and pour in a little Maderia wine. Put in the squabs and cover them with a piece of white paper. Roast in a hot oven for twelve minutes, and then remove the paper. Wash the livers and place them with the squabs, cooking three minutes more. Have ready some buttered toast, crush the livers, spread them over the toast, and dip the toast in the gravy from the pan. Serve half a bird on each slice of toast.

A good book is a fine companion. Especiallv a bank book—New Orleans Picayune.

THE FEMININE SIDE OF FARM LIFE.

This is fittingly set forth in the Breeders' Gazette, where Bessie L. Putnam says: "The spirit of progressiveness has invaded rural precincts, and the woman of the farm is awakening to her own possibilites. While the town club-woman is clamoring for suffrage and other legitimate recognition, her unsophisticated sister is quietly gathering up privileges undreamed of a generation ago. Passive endurance has given place to actual advancement. The twentieth century woman feels her own power and resents the implications of helplessness and oppression lavished upon her foremothers.

True, she must work. But soap and candle-making, wool-picking, spinning, weaving, knitting, and to a great extent, dressmaking have been eliminated from her list of duties. Butter and cheese-making have yielded to the doctrine of co-operation, and the milk is wheeled to the factory daily in large cans; or, if near a trolley car, it is whisked away to the city to be retailed at fancy prices.

Invention has lightened her burden in many ways. The washing machine has replaced the washboard, and starched clothes go to the city laundry. The shallow dug well of surface water has given place to the more permanent one drilled in the solid rock; this, with wind mill and tank, supplies all the conveniences of city water without its impurities. Kerosene or gasolene stove dispenses with the mid-summer sweating over culinary matters; hard coal burner or furnace brings summer heat to the country home in mid-winter. The incubator hatches chicks by the hundred where the old hen hatched them by dozen, with never a mite to annoy. Nor does this superabundance glut the market and bring prices down to almost nothing; cold storage and rapid transit have extended the market radius almost indefinitely.

Her fertile brain discovers other sources of pin-money, more alluring than shop or factory. Bee-keeping is both pleasant and profitable, requiring comparative little time or capital. Fresh canned or evaporated fruit, vegetables, herbs, cottage cheese, nuts, flowers, and in autumn bright-colored leaves or berries find ready sale in many places; and if there is no local demand the business woman is learning the use of printer's ink.

Only the most wealthy city woman can as often secure the luxury of a horse and carriage. Telephone and trolley have broken that great ban to farm life—isolation. Rural free delivery brings the morning paper and the current magazine to her door. University extension enables her to enjoy the best in literature and science. Centralization and township high school assure to her children a liberal education. Her lawn is smoothly shorn. Flowers and vines, doubly enjoyed because of her own cultivation rather than the product of a professional gardener's skill, adorn the grounds; and the choicest of "potting soils" and fertilizers are at hand. Her hammock needs no screen to shut out the view from an over-inquisitive neighbor; the broad horizon is stretched out before her. Her children have a more delightful playground than the most munificent park svstem has yet devised, one on which "keep off the grass" placards and contaminating influences are alike unknown. Butterfly and blossom give variety to the scene, while the bird and squirrel keep house among the branches, almost unmindful of their child admirers who are playing keep house below. Her camera catches the choicest scenes in Nature; and as these shadows are permanently fixed to please the eye of self and friend the substance appreciates the value. Truly, amateur photography has an important mission in the esthetic culture of the rural home.

A WORD TO THE GIRLS.

There are thousand of girls in California who will become the wives of farmers in the not far distant future. They will be the helpmates of the young men who have selected farming life for a vocation. These girls should qualify themselves for intelligent wives by educating their minds to make the home beautiful. They should study plant life, learn how to grow pretty flowers, keep the beds in the lawn radiant with foliage and thereby give an inviting appearance to the "home place."

It does not require an expensive course of reading and study on the part of the young woman to fill her mind with practical ideas of flower and plant culture, which will always come in good stead when she is busy with the cares of the home and has no time to read. We know a young woman who spends an hour each day reading books pertaining to floral culture, making copious notes in a copy-book for future reference. This girl will be an encyclopedia of knowledge before she is twenty years old, and not only be able to grow choice flowers and plants but tell others how to succeed in garden plant raising.

Aside from the practical there is the pleasure to be derived from studying vegetable and plant life, and no housewife in California is qualified who is not well posted on the care of flowers, plants and vegetables. So the advice of the Cultivator to the girls of this State is to qualify yourselves as practical fioriculturists before you assume the duties of a wife.

TAKE A COURSE NEXT YEAR.

The experience a young man gains on the farm is a most valuable asset. He should, therefore, reflect well before deciding to throw it away by entering some other profession in which this experience is of no special value. This is particularly true when we consided the extent to which most of the other professions are crowded and the unusual opportunities now offered in agriculture. Every ambitious farmer's boy in California should plan to supplement this experience by a training in the College of Agriculture, so as to be prepared for the greatest possible success. Ten years ago it was freely predicted that the demand for trained men in agriculture would soon be over supplied. The supply today is many times greater, and the demand is farther from being supplied than ever and is growing more rapidly than the number of young men fitting themselves to take such positions is increasing.

To place this sort of training within the reach of the largest possible number of young men who now live on the farm and who cannot avail themselves of a regular course, Short Courses in Agriculture are offered at the University each year. One relates to soil fertility, crop production, horticulture, etc. Another relates to animal feeding, breeding, judging and animal diseases, and the other relates to dairying in all of its phases, from the production of milk to the manufacturing and marketing of butter and cheese.

Practical experience is given in these courses in handling commercial fertilizers, planting and pruning trees, judging live stock, diagnosing diseases, manufacturing butter and cheese and in testing milk, etc.

Agriculture in all its phases has come to be a scientific study. The young man who wishes to obtain the best results will be the one who has fortified himself with the best basis for work by education along the lines he intends to pursue.

MAKE YOUR CHILDREN LOOK NICE.

It is criminal, says a writer, for women, for parents, or guardians to neglect the care of the figure, hands or skin of their children. Young people can hardlv have too much fresh air or exercise, but they need not let the skin be burnt up by the sun, or the hands be spread by too much exercise. Girls should not be allowed to eat anything and everything whether good for their complexion or not. Too much butter, too little cream and milk, too much meat and hot cakes and quick eating all militate against beauty of form and face.

SOME FOOLISH FACTS.

Barnum was a generous man; he gave everybody a show.

Washington's first ride was when he took a hack at the cherry tree.

A prize fight is a striking affair, and a cashier's business is a paying one.

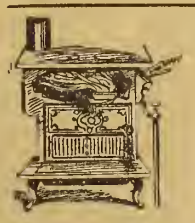
The most important needle work in the world has been done by the mariner's compass.

A woman cries when she is tickled and laughs when she is mad.

An architect is a designing man.

A milliner is always a trim creature.

The path of duty is through the custom house.



BURN AIR AND SAVE FUEL

You can do it with the

HAGUE IMPROVED DOMESTIC OIL BURNER

It burns more air than any other burner on the market. Can be fitted to stoves, ranges, furnaces, and all kinds of heating systems. Simplest and most economical burner on the market. If you want the most heat for the least money, write for information to

Hague Domestic Oil Burner Co., 810 So. Spring St., Los Angeles, Cal.

Security Savings Bank

LARGEST SAVINGS BANK IN SO. CALIFORNIA

Those unable to visit the bank in person may open their accounts and transact all their banking business with this institution by mail.

4% INTEREST PAID ON TERM DEPOSITS

HERMAN W. HELLMAN BUILDING, LOS ANGELES, CAL.

Write for booklet "A" on banking by mail. Rainfall Chart and 112-page Atlas sent free.

IT'S PENNY WISE

Policy to set out a good tree, costing good money and then let the sun burn the bark, or the rabbits gnaw it when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Mfg. Co., 2124 Willow St., Los Angeles.

In this issue of the Cultivator we prints the advertisement of The W. W. Howard Co., successors to W. W. Howard, this company having purchased all his fine S. C. White Leghorns and will hereafter keep the stock at the farm owned by the company at Clearwater. E. T. Howe is the manager of the new company and his address is 2329 Hermosa St., Los Angeles. Mr. Howe is a thorough chicken man and will keep up the good name of the chickens coming from The Howard Company.

FOR SALE

One Holt 65 H. P. Agricultural traction engine, with extra wide wheel base, with water wagon, plow cart, and all necessary attachments.

One Holt Junior Combined Steam Harvester, fully equipped.

Six Stockton Five-Gang Plows, Disc, Seeder, etc.

All in thorough repair, and used but two seasons; for sale on account of lands being subdivided, and sold off by the Chino Land and Water Company.

Los Angeles Markets.

Los Angeles, Dec. 21, 1905.

Butter remains unchanged. Eggs are firm and scarce and are expected to advance within the next few days, on account of the limited supply and keen holiday demand. Vegetables are particularly active and prices are up on most varieties. Poultry is in plentiful supply, but heavier turkeys are wanted. Prices unchanged. Fresh fruits are scarce and demand good.

VETERINARY DEPARTMENT

BY DR. W. J. OLIVER,
318 East Second St., Los Angeles

To the end that this department may be made as valuable to the subscribers as possible, we ask observance of the following: Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease ap eared. Give your name and address, which will not appear in the paper if you so request. No charge whatever is made for such questions as are answered through the colums of the Cultivator, but when an immediate mail answer is wished Dr. Oliver asks an additional fee of $1.00 and will give immediate attention and reply by mail. In such case write Dr. W. J. Oliver, 318 E. Second St., Los Angeles, Cal.

Questions should be in by Monday to be answered in the following Friday's paper.

BOG SPAVIN.

Editor Cultivator.—I have a mule having what is known as a blood or bog spavin. Swelling seems to be increasing rapidly. Mule not lame. Kindly advise how to kill the spavin. —Reader. Upland.

Hose the swollen joint twice a day with good strong stream of water, and rub in the following liniment once a day: Aqua ammonia, spirits turpentine, raw linseed oil, equal parts. Shake before using.

* * *

SAMINITIS.

Editor Cultivator.—I have a young mare in care while owner is away. Can you advise me what to do for her? She eats and looks well, but is not able to do much work. Sometimes when I drive her five or six miles after standing a little while she will be stiff most in her front legs, but more or less all over. Sometimes in the morning and even through the day she will lie on her side and stretch the legs from her, and don't want to get up. When she gets up will be stiff all over and it takes a little while for her to limber up and walk to the manger to eat; will be that way sometimes without being worked. She is five years old, and has not done any heavy work, but may have been driven too hard in buggy when two or three years old.—A Subscriber, Etiwanda.

This is a case of saminitis. If you will examine the feet you will find the frog hard and shriveled. You should keep the feet packed with white rock packing or linseed meal. The white rock packing is better as you can fill the shoe and it will remain without tying in. Apply a light blister around the coronet.

FLOW OF THE YULE-TIME TIDE.

(Continued from First Page)

flowers, where the ever blooming and bearing lemon and orange grow, where the valleys and plains stretch picturesquely in variegated green with the distant mountains crowned with snow, suggestive with the day in the far Northlands, is just as gay as anywhere else in the world. Santa Claus doffs his robes for a shirt waist and steals down the chimneys to fill the pendant stockings over the hearth and deck the evergreen trees in the parlor and to store the pantry with good things. There is mystery in the air. All are under the spell of the witchery of concealment. The hearts of the little ones here grow just as large with expectancy as the hearts of those in the snowy lands where the jingling bells of Kriskringle-in-furs resound on the air. Old hearts forget their years and softly beat the tattoo of early childhood again.

Good friends have we not oft been told
'Tis not the years that make us old.
It's what we've borne in mind and mood;
Of the good enjoyed or ills withstood.

Bundles and packages long concealed are brought out, and sweet suprises rule everywhere. It is so easy here to remember a friend—even with a simple flower, at no more cost than the plucking of it. Notwithstanding their great profusion, flowers are just as much appreciated here as in lands where they are scarce, and the recipient of a bouttoniere or bouquet enjoys the gift with as much appreciation as a mark of personal favor as if it were rare and costly. There is no region more favorable for the observance of Christmas Day than this, our sunny California.

Gentle reader, we wish you a "Merry Christmas."

SOME SUNNYSIDE SALES.

G. A. Murphy, proprietor of the Sunnyside Stock Farm at Perkins, Sacramento County, California, writes us that he has put himself in line for greatly improving his high grade Berkshire hogs by the purchase of a fine young sow bred by H. C. & H. B. Harpending of New York and a Premier boar from Gentry of Sedalia, Missouri. This will give new blood and make the already celebrated stock of this ranch more noted even than in the past.

Mr. Murphy adds that late sales have been made to J. P. Smith of a Berkshire boar and another to J. A. Harrold, Woodland, California. another to H. A. Hallott. Woodland, California, another to Fay Bros., Etna. who also took one of his short horn heifers; another sale of a fine young bred sow was made to H. M. Harlow of Perkins and another to John Sago, Freport, California.

This looks as if Mr. Murphy is making some sales of stock which will raise the grade of California thoroughbreds.

NEW COMPANY—OLD INCUBATOR.

The announcement of the Stockton Incubator Co. appears in this issue of the Cultivator, as it will during the coming season. This company has changed hands within the last few months and is now owned and managed by Messrs. Marshall & Barnes. Mr. Barnes has been associated with the manufacture of the Stockton Incubator for a great many years, but it is only recently that he has become connected with the business management. Mr. Marshall, while only recently from the East, is becoming an enthusiastic Californian and is determined to push the manufacture of this machine which has become popular in many sections as an economical and effective hatchin machine.

Readers who may be interested in incubators should drop word to Stockton Incubator Co. and get information which may aid them in purchasing for the coming season's work.

The Haetville Broom Factory is about ready for operation.

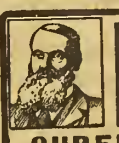
FACTS ABOUT CANCER.

A new booklet published at considerable expense by L. T. Leach, M. D., of 416 Main street, Dallas, Texas, tells the cause of Cancer and instructs in the care of the patient. Tells what to do in case of bleeding, pain, odor, etc., and is a valuable guide in the management of any case. It advises the best method of treatment, and the reasons why. In short, it is a book that you will value for its information. It will be sent by mail, prepaid, on receipt of ten cents, stamps or coin.



FITS EPILEPSY

CURED TO STAY CURED

Eminent Judges, Ministers, Congressmen and the medical press declare my cures permanent. I cure after others fail. It doesn't matter how severe the case, I can cure it. I want to send you the proof. I will send you my booklet on Epilepsy by return mail FREE. Write to-day.

Dr. W. Towns, Fond du Lac, Wis.

From the San Francisco Examiner:

BIG CANCER IN EACH BREAST

IN WOMAN'S BREAST ANY LUMP IS CANCER

The most wonderful cure of cancer on record is the case of Mrs. G. N. Morris of 224½ First street, Portland, Oregon. She had a small lump in one breast which suddenly poisoned deep, and caused a cancer also in the other breast, when each breast became almost as large as a person's head, and cure was thought to be impossible. About that time the papers were full of commendations about another marvelous cure by Dr. and Mrs. Dr. Chamley & Co. of 25 Third street, San Francisco, who cure cancers without knife or pain, charge nothing until cured and offer $1,000 if they fail on any cancer or tumor they treat before it has poisoned deep glands or caused any hemorrhage. Such cases they always refuse as past cure. She wrote for their free book which teaches that any lump in a woman's breast is cancer. She saw a dozen or more people here and wrote to others, all of whom praised and thanked Dr. Chamley for saving their lives. They cured Mrs. Morris in two weeks. They use no X-Ray fraud nor mail order swindle. His book is full of testimonials from doctors, ministers, bankers and others, such as E. J. (Lucky) Baldwin, Arcadia, Cal., who was said to be dying three years ago with cancers, and was cured by Dr. Chamley; B. F. Porter, Second Vice-President and General Manager of San Francisco and Northwestern Railway Co., Eureka, Cal. Mrs. Elizabeth Crosthwaite, President of Golden Gate Woman's Club, 954 Arlington Avenue, Oakland, Cal., cured of cancer in breast and armpit. They, as well as Mrs. Morris and scores of others, say Dr. Chamley is, without doubt, the most successful cancer specialist living. He has the name of having cured more cancers in just one-third of a century than any other Doctor living.

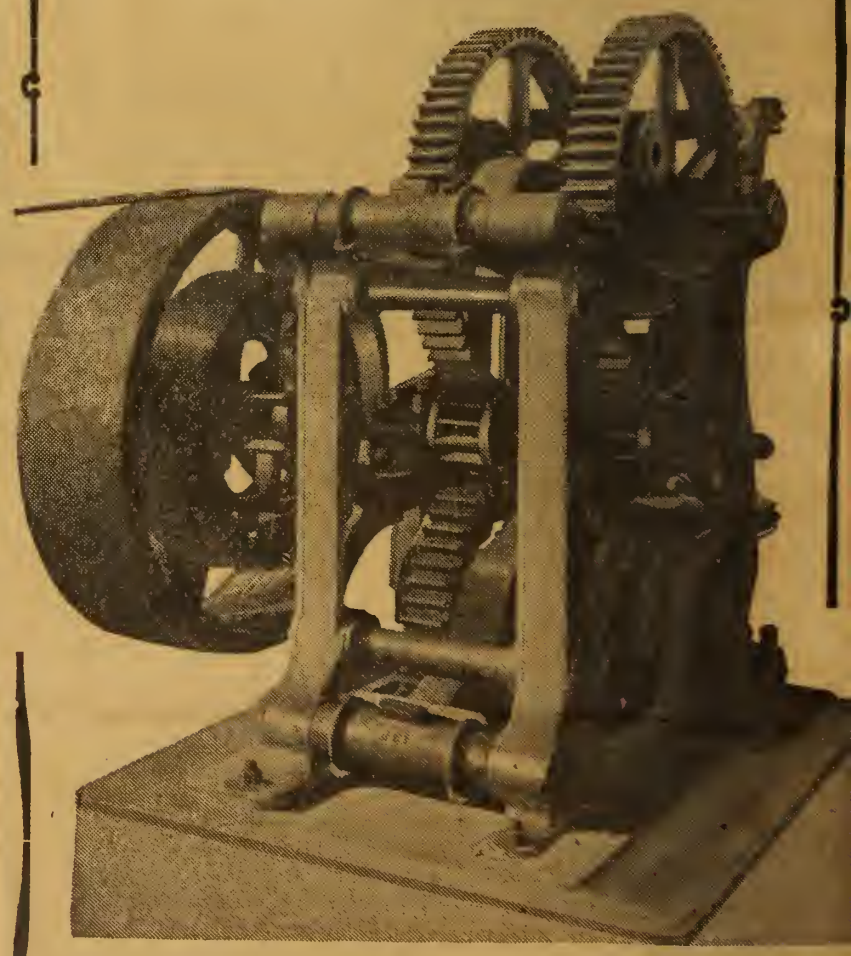
The Record for the New Pomona Pumps

FOR 1905

Not a Broken Rod, Not a Plunger Pulled for Repairs



The irrigation season just closing has demonstrated fully the high merit and efficiency of the New Pomona Pumps.

Every one installed has passed through the season's run without breaking a rod or requiring the valves to be pulled for repairs, proving conclusively that the ideal beam motion used by these pumps is more than has been claimed for it.

The slow, uniform motion upward and the quick, smooth down motion handles the rods without any jerk or jar, while the long lap of the plungers in passing the dead points, keeps the water column in continuous motion upward and a steady stream flowing from the discharge pipe.

They have passed through the experimental period and are built better than ever for next year.

The ideal pump for irrigation purposes. Send for catalog.

INTERESTING ITEMS ABOUT SAN FRANCISCO

Estimated population June, 1904, was 485,000.

City's area, in acres, 30,000.

Miles of streets, 850.

Miles of paved streets, 270.

Miles of street railways, 264.

Since the San Francisco mint was established in 1854, the complete coinage to June, 1905, $1,600,000,000.

Number of banks, 51.

Ranks first in the world in the use of the telephone, having one for about every ten inhabitants, or a total of over 45,000 telephones.

Street cars are operated over a 25.4 per cent grade.

Mean annual temperature, based on records of half a century, 56 degrees.

The first ship that sailed into San Francisco bay was the little Spanish ship, "San Carlos," which arrived in 1775, under the commandante Ayala, from Mexico.

San Francisco harbor is the largest land-locked harbor in the world; having a thousand miles of shore line, and offering a free sweep of water navigable for ocean vessels over a stretch of almost sixty miles.

The greatest ship-building port on the shores of the Pacific Ocean.

MARKET STREET, SAN FRANCISCO Cour. Cal. Pro. Com.

IT'S NEARLY ALIVE!

Something That's the Most Nearly Alive Stuff in the World

It's Nearly Alive

You know an egg is just an undeveloped chicken; all the yolk of an egg needs to make it LIVE is the mere heat of hatching. It is, therefore, pretty near life itself. That's why the yolk of an egg is such powerful nourishment when taken as food.

A yolk of an egg is about two-thirds phosphoric acid, and phosphorous is the most nearly ALIVE STUFF in the world. It's the phosphorous that's on the end of the match that makes it burst into a flame when you rub it. Drugstore phosphorous will burst into flames if you merely touch it, unless you keep it in water. But that's not the kind of phosphourous that we use as food. But the phosphorous that makes the yolk of an egg turn into a LIVING CHICK by the mere heat of hatching, is the same phosphorous that makes the heart or germ in seeds sprout into a LIVING, GROWING PLANT, by the mere heat of the soil. And it's phosphorous that makes the CHICKS GROW, and it's phosphorous that makes the hens lay.

PHOSPHOROUS—Where do you get it—how do you get it? Well, we'll tell you about that some future time. But we aim to put enough of it in Coulson's Special Dry Chick Feed to make the chicks grow, and enough in Coulson's Egg Food to make your hens lay. IT'S A GREAT IMPROVEMENT—the other manufacturers haven't found it out yet. They may imitate COULSON'S FOODS in looks, but they can't imitate the secret ingredients and result-getting qualities.

A Sack of Coulson's Egg Food.

A mixed feed for chickens to make the hens lay lots of eggs. This feed is composed of about three-fourths ground grains or mill feeds and nearly a quarter of animal meals, that is fresh, fine ground bone, dried blood and the cooked heart and liver meal.

Your hens will get more egg-making material out of 1 sack of Coulson's Egg Food than they would from two sacks of corn or wheat or mill feeds. Your hens will relish a warm mash in the morning of Coulson's Egg Food, and they will lay many more eggs if you will give it to them.

Buy it by the ton and get your hens to laying. That's what they are for and that's what Coulson's food is good for.. Therefore it is to your interest to always insist upon getting COULSON'S.

SKINNING AND DRESSING BEEF AT ARMOUR'S

The hearts, livers and kidneys are kept apart by themselves. These are then cooked up in a certain amount of the juice of extract of beef. Then after they have been cooked for five hours, they are put in big pans and baked; then they are put in a heated cylinder with a screw-propeller running through it, and into this they are dumped at one end, and they are then baked some more, and churned around, and come out at the otheer end of the machine in the form of Fine Meal; thoroughly cooked, baked and dried, and ground up into Meal. This is then run over screens and the little pieces, about the size of a pin head, are used in making COULSON'S SPECIAL DRY CHICK FEED, and the fine meal is used in making COULSON'S EGG FOOD, a mixed feed for making hens lay.

It's To Your Interest

To make as much money out of your poultry as any one else, and more, if you can.

It is to your interest to feed your hens that which will give them the greatest returns in eggs.

It is to your interest to have your hens in condition to lay when eggs are worth something.

The secret of success is in knowing how. COULSON'S EGG FOOD is just what your hens need. Ask your grain dealer for it. Beware of imitations.

It's the Life Giving Qualities

In Coulson's Foods—that's why Coulson's Special Dry Chick Feed raises the NICEST, LARGEST and HEALTHIEST CHICKS, and it's the life-giving qualities in Coulson's Egg Food that makes HENS LAY strong, FERTILE EGGS. Now is the time for such.

Something About Meat

Analyses of Animal Meals vary greatly, according to the class of animals it came from, and also from what part of the anatomy. Knowing that certain kinds of Animal Foods were better and much more nutritious than others, and therefore would give better results, we have made arrangements with the Armour Packing Co. to prepare for us a certain class of Animal Meal that is PARTICULARLY VALUABLE FOR MAKING HENS LAY the greatest number of eggs.

It isn't everybody that knows about this difference in Animal Meals, therefore they are not liable to make a food that would give as good results as Coulson's.

Therefore, you should remember this, and ALWAYS INSIST UPON GETTING COULSON'S. Nothing that's just as good. Remember, nine times out of every ten, the dealer who tries to sell you something which he tells you is JUST AS GOOD is evidently trying to sell you something that does not cost him as much, and that he will probably MAKE MORE MONEY ON.

Yreka, Calif., Nov. 23, 1905.
Coulson Poultry & Stock Food Co.,
Petaluma, Calif.

Gentlemen:

Enclosed find draft for $25.00; $16.00 for 10 sacks of Coulson's Egg Food, and $9.00 to pay freight on same. Send as before to Grenada, Siskiyou Co., on the Shasta Route of the S. P. Co., between Montague and Gazelle.

The Egg Food has given SUCH GOOD SATISFACTION that I want another lot; during the cold weather it is just what they need.

Yours respectfully,
(Signed) G. C. JULIEN.

December 15, 1905.

I was getting only 6 eggs a day from 225 hens. On October 15th I purchased a ton of Coulson's Egg Food and commenced feeding it to the hens, one meal a day, as their morning mash. Now, December 15th, two months later, they are laying 60 eggs a day, and increasing right along.

A. W. STEVENS.

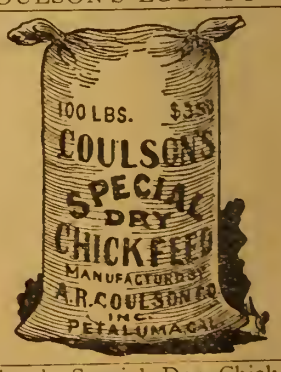
It's Yours

No matter if you are a thousand miles away, you can get it. Anything is yours if you only want it—anything. So if you have any hens you want them to have this food, so you go to the feed stores and say I want a ton of Coulson's Egg Food for my hens. I want my hens to have good feed during the winter season, as well as every other season, and I understand that the most successful poultrymen feed their hens Coulson's feed and I am going to feed it too.

If your dealer says, we haven't got Coulson's, but we can give ————, which is just as good, much better, cheaper, etc., just tell him that you are not looking for a cheaper or better feed. You want COULSON'S and you want it sure, and NO OTHER KIND will do.

Ask him to send immediately and get it for you, or there are other stores that WILL get it for you.

Over 600 stores on the Pacific Coast sell COULSON'S CHICK FOOD and COULSON'S EGG FOOD.



Coulson's Special Dry Chick Feed is all granulated pieces and the little chicks eat every bit of it. It contains THE FOOD THAT WILL DEVELOP THE CHICK in every way, making bone, flesh and feathers.

It contains the LIFE-GIVING QUALITIES. It may cost you more than some other Chick Feeds, but it's worth it. You bet!

Insist upon getting COULSON'S for YOUR SUCCESS may depend upon it; REMEMBER, YOUR SUCCESS.

$50 in Gold as a present for some one—We'll just put it in one of the 100-lb. sacks of Coulson's Special Dry Chick Feed

Coulson Poultry and Stock Food Co.

The Work of Pear Thrips in California

Extracts from a Bulletin by Dudley Moulton, Entomologist for Santa Clara County

During the months February to April, if one were to examine closely the branches of many of the fruit trees in the Santa Clara Valley, he would find numerous brown insects, about one-twentieth of an inch long, hidden within the buds, blossoms or leaves, and if these are disturbed by being shaken out over one's hand, they suddenly become active, raise up the tip of the abdomen, and lifting and disentangling their wings, fly away. They are so small and their wings so transparent, that unless one watches very closely they disappear even before one's eyes.

The specific injury to blossoms varies in different plants. Trees may be divided into two groups as regards the structure of the blossom bud: (1) in which a single bud produces one blossom, such as the almond, apricot and peach; and (2) where one bud opens out into a cluster of blossoms, which later produce a cluster of fruit, such as the prune, cherry, pear and apple. In the development of the bud, the winter protecting scales are the first to spread, thus permitting the insects to enter at the tip. In the apricot and peach the insect forces its way in at the tip and down between the sheath scales and the blossom, and especially on the very tender blossom stalk in the center at the base; later it feeds on the inner parts of the flower. When the insect is once inside the bud it takes but a comparatively short time to destroy the blossom. Many buds on peach and apricot trees, thus injured, will fall with a slight tapping of the limb.

FIG. 3. Imperial Prune branches. Blossoms and leaf buds affected. Every blossom on these twigs has been killed. On the two inner branches many of the clusters have fallen.

Thrips do even more serious injury to blossoms of the second group (prunes, cherries, etc.) than they do to those of the first. The insect enters at the tip of the swelling bud and forces itself down the center of the cluster, injuring each blossom on the inner, contiguous side. When thus affected, natural growth ceases. For a time the untouched outer side of each budlet grows in the natural way, while the injured inner side has ceased growing. The deformity thus produced has caused each budlet to turn in toward the center, and all the cluster eventually fall. The injury done by thrips during the early opening of the bud is by far the most serious. As blossoms develop thrips display their preference for certain flower parts; in cherries and prunes, the tips of the petals and the stigma and style are the parts that suffer.

The feeding of thrips in leaf buds and on tender foliage is almost as disastrous as when they attack blossoms. In many cases where trees have suffered injury for three or four days it takes several months for them to again put forth new buds and foliage and to again assume their natural growth, and then often they appear sickly for the entire year. The rapidity with which whole orchards have been injured marks this as one of the worst pests which we have ever had to fight.

The insect is known to feed on the following plants, and it is probable that even this list is not complete: Apricot (several varieties), apple, almond, cherry, fig, pear, (Doyenne du Comice and Bartlett preferred), prune (English), and peach (Muir and Clings (Nichols) preferred). As mentioned, the insect gives preference to certain varieties of prunes, peaches and pears, and of the other fruits all seem to be affected alike. The Imperial prune is especially susceptible to the attacks of thrips.

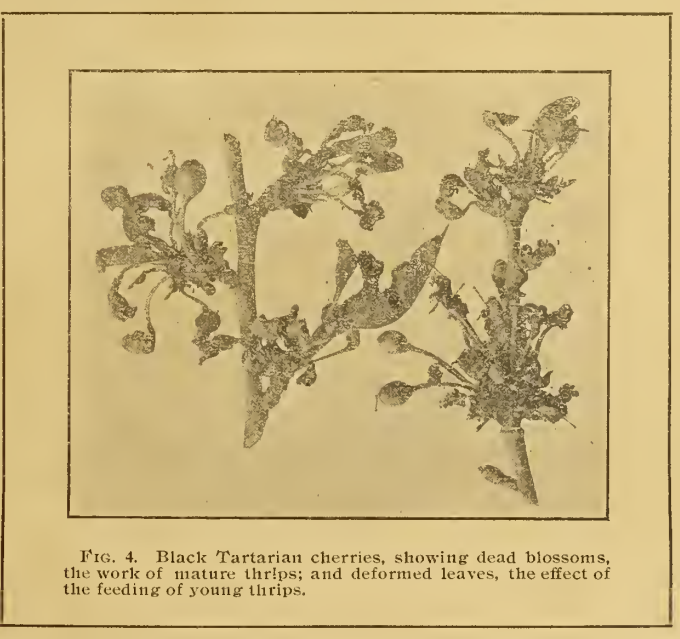

FIG. 4. Black Tartarian cherries, showing dead blossoms, the work of mature thrips; and deformed leaves, the effect of the feeding of young thrips.

Young thrips are perfectly helpless creatures and subject to the attacks of other insects, but they seem to be able to protect themselves in a remarkable way. They are commonly secreted in the terminal tips of the branches, but in some cases they seem to take advantage of certain tendencies in the growth of the plant on which they happen to feed. Newly opening pear or apple leaves have a tendency to roll from the inside inward. Young thrips find this inner protected surface a most desirable place for food and shelter, and in feeding, the upper leaf surface alone is weakened, which causes the leaf to roll up until eventually it becomes rolled up tight (Fig. 6). In doing this the insects get the tenderest part of the leaf for their food, and also secure protection for themselves. With such shelter no ordinary predaceous insect can reach them. Often on more mature leaves the insects in feeding cause a deadening of the margin, and the leaf in its development is forced into an abnormal, cup-shaped growth. This is a very characteristic injury on pear trees (Fig. 7).

It is the young thrips which injures fruit. Prunes especially are affected, although a similar scab is found on cherries, apricots and pears. Well-set fruit gets to be about the size of a pea before the old blossom is sloughed off, and under cover of this dead blossom, on almost every prune where thrips were present, one or more of the young could be found, also a small abrasion on the skin of the fruit where the insect had been feeding. We have followed this abrasion of the skin with the thrips present to the mature fruit with its scab. Only the skin of the fruit is injured, and the marking enlarges with the growth of the fruit. The scab was especially marked last year where thrips were found, and it was very prevalent again this year. It must be remarked, however, that something other than thrips has caused much of the scab on prunes during the past year.

FIG. 6. Bartlett Pear. Dead blossom clusters conspicuous; one late straggling blossom left untouched, the adult thrips having all left the tree. Leaves deformed.

(Continued on Page 618)

PRUNES IN CANS.

"Prunes! Well, that subject was worn threadbare long ago," some of my hearers will tell me, "and for prunes in tin cans, the late Cured Fruit Association tried that and it did not prove a success." Let me here tell you that a processed prune in tin cans and an unprocessed prune in tin cans are two entirely different propositions.

Some six years ago a prominent San Jose packer said to me, "Bowers, a fortune awaits the party who can devise or invent some way to pack prunes in their natural state without processing them. From that time until something like a year ago I made many experiments along that line, until I finally discovered a way to keep prunes or any other dried fruit for an indefinite period. Simply fill glass jars or tin cans, hermetically seal, and sterilize.

My next move was to experiment and find out just the condition the fruit should be in, the kind of package and what the trade thought of the proposition.

The fruit—I found by experiments that it made no difference in keeping qualities whether the fruit was moist or very dry, the same results were obtained. If put up moist, at the end of the year a can opened showed its fruit moist, and if dry when put up the fruit was dry when opened. This proved to me one thing. That moist fruit kept in fine condition and at that stage was the condition in which it should be put up.

The package—On account of breakage and weight, I found glass jars too expensive, only for exhibition purposes. I then corresponded with a number of can makers and can making machinery firms, and finally adopted the sanitary can made by the Max Ames Machine Co., Mount Vernon, N. Y., because this can has the whole top off and will admit a press plunger to press the fruit solid in the can. The top is then put on by machinery, making a double seam. No heat or solder is used in closing or sealing the can, and when goods are finished a neat, clean package is the result.

The trade—I submitted to the Eastern trade this proposition. I would pack some time in the future prunes in tin cans, in their natural state, and make only three sizes as follows: 30 to 50 size, No. 1; 50 to 70 size, No. 2; 70 to 100 size, No. 3. I also stated that I would make three sizes of cans; small size to hold 1¼ pounds of fruit; medium size to hold 2½ pounds of fruit, and large size to hold 5 pounds of fruit; the small can to be 2½ inches high; the medium to be 5 inches, and the large to be 10 inches high, all cans to be 4 3-16 inches in diameter, the same case for all sizes holding 12 large, 24 medium, and 48 small cans. Each can to be labeled and the price to be put on the label in large figures, the price being the consumers price, as follows: White label—No. 1, large can, 75 cents; medium can, 40 cents; small can, 25 cents.

Red label, No 2—Large can, 70 cents; medium, 35 cents; small, 20 cents.

Yellow label, No. 3—Large can, 70 cents; medium, 35 cents; small can, 15 cents.

I wrote to seventeen brokers who are large handlers of dried fruit, many of them handling one hundred or more cars of prunes alone. I received answers from fourteen. Nine of these wrote me very encouraging letters. Two said that I "had the best prune proposition ever brought before the American people." Five said: "Just as soon as you get your proposition in working shape we want the exclusive territory of a given state or states to sell these goods in." One said: "The price on the can does not interest us. Let the retailer and the consumer fight it out among themselves. The size by numbers was considered a good change by all. Eight firms thought the price on the cans was all right. These nine letters came from Boston, New York, Philadelphia, Baltimore, St. Louis, Columbus, Chicago, Milwaukee, Vancouver.

I have spent a good deal of time and postage to gather information in regard to the prune situation throughout the East, and I have found many conditions that are against the grower. One thing more than another is the wide range of prices. Take Philadelphia, for instance. Last summer a party interested in the prune industry visited that city. On a certain street one grocer priced Santa Clara prunes of a certain brand at 8 cents; two blocks further up town another grocer quoted the same brand and size at 15 cents per pound; then up town at a store in the fashionable part of the town 25 cents per pound was quoted for the same brand. Such a range of prices will kill any industry. The first price does not help the grower any, and the last named price is prohibitory. While by the system I have given the price would be the same everywhere.

A gentleman well known to every prune grower in the Santa Clara Valley said: "Do not make the price so high that the poor people cannot buy." I will answer the above by saying that people who buy prunes would rather pay 15 cents per pound for prunes in a nice clean package than to qay 8 cents for the majority of prunes offered for sale at many of the Eastern retail groceries. Many of these prunes are dirty, dusty, and covered with flies.

Saving to growers—Every grower who dries his own fruit well knows that some seasons his last prunes give him a great deal of trouble in getting them dry. They will hang sometimes two or three weeks in the trays. They are cured but not dry. They are fine fruit, but the packer will not receive them. He wants them dry. Right here is where the can proposition makes a showing. These prunes are just right to can, just right to pack. I claim that the growers can save 200 pounds of fruit on each dry ton, or, in other words, a ton of fruit ready for the cans would only weigh 1800 pounds or less when dry enough for the commercial packer.

On a crop of 120,000,000 pounds of prunes for the State of California then save this 200 pounds from every 2,000 pounds and we will have saved 133,333 pounds of prunes that are doing no one any good. We dry it out of the prunes and the commercial packer puts it back in the shape of water and sells this water for prunes. Counting 60 as the average size and prunes at 3-cent basis or four cents per pound, we would have the enormous sum of $533,333. Enough money to put up a factory large enough to pack in tins the entire crop of the State. The same amount of money saved would put up and equip ten factories in different parts of the State to do the same work, and all from only one year's crop.

The question has been asked me: "How about the cost of packing?" In a small way the cost will be per case about as follows: Cans, 48 cents; labels, 8 cents; case, 10 cents; incidentals, 14; total, 80 cents. Each case will hold 60 pounds net of fruit. Do I hear some one say too costly to pack? Let us see. The French packer comes to our State to buy our prunes, pays freight and duty, sends them back to the United States, and we pay the freight and duty. Can we not compete with our own goods packed in tin by the French packer if we adopt his way of packing?

To give this mode of packing a severe test I placed on a shelf in my kitchen near and almost over the cook stove, a lot of cans filled with prunes about the fifth of January and left them there until the last of August. Then every ten days for two months I opened a can. Every one was in perfect condition. Not a sign of mould or sugarcoat, and everyone who saw them was astonished at their fine appearance.

Railroad rates on canned goods from common shipping points to points east of the Mississippi are $15 per ton according to present railroad classifications, a saving of $5 per ton over boxed prune rates. This one thing would go a long way toward cutting down the packing expenses. We could have a good market for our prunes in the Orient and the Philippines if they could be kept any time after they arrive there. A processed prune has been a failure in the Philippines. They will not keep in that hot, moist climate. But in this can proposition I think that prunes can be packed so there is absolutely no loss from mould or worms. So as to be sure of this, a lot have been sent to Manilla to be left there three and six months, and then to be returned to be opened to ascertain their keeping qualities, and then a report will be published giving a full account of the work done.

DISINFECTION OF VINE CUTTINGS.

As the season for vine planting approaches a few hints regarding some necessary precautions in the choice and treatment of cuttings may be useful.

Every care should be taken to avoid any unnecessary risk of introducing vine diseases with the cuttings and roots used. There are only two serious diseases of the vine in California that are liable to be introduced on cuttings or roots. These are the Phylloxera and the Anaheim disease. Such diseases as Oidum (mildew) and Erinose may be brought in by this means, but as they exist practically in every vineyard district in the State and do not threaten the life of the vineyard no particular precautions are necessary in their regard.

Of course, if we are to have healthy, well bearing vines we must start with strong, healthy cuttings, therefore all cuttings showing poor growth, incomplete maturity. or signs of any disease should be rejected.

* * *

Odium.—Cuttings sometimes show blackened irregular spots or fern-like markings which are a sign that they have been attacked by Oidium. Such cuttings should be rejected, not for fear of introducing the disease into the vineyard, but because such cuttings will not make the strongest vines. A good cutting should have a clear, smooth bark, a solid light colored pith and hard wood.

* * *

Anaheim Disease.—A cutting badly attacked by this disease will not show the characteristic of a good cutting given above. It is possible, however, to have a cutting taken from a slightly diseased vine which will have these characteristics, but which at the same time is quite capable of introducing the disease. As there is no known means of distinguishing such cutting from a cutting taken from a healthy vine the only way to avoid the introduction of this disease is to use no cuttings which come from an infected district, as there is no known method of treatment that will free a cutting or root from infection.

Where possible the best thing to do is to obtain cuttings in your immediate neighborhood. Where this is impossible all that can be done is to avoid all the regions where the Anaheim disease is known to exist.

These regions, as given by Mr.N. B. Pierce in his address to the twenty-ninth Fruit Growers' Convention. are the following: (1) All of Southern California; (2) The upper end of the Sacramento Valley, including Tehama, Butte, Colusa, Yuba and Sutter counties, and (3) the Santa Clara Valley, including San Mateo, Santa Clara, Santa Cruz and Alameda counties.

While the disease may not exist in all parts of these counties it is impossible to define its exact limits, and, therefore, it is unsafe for a vineyardist in a county presumably free from the disease to get cuttings or roots from any part of a country where it exists.

The disease is so serious, and with our present knowledge so nearly incontrollable in practice that it would be folly to run any risk that can be avoided of allowing it to enter a new region.

* * *

Phylloxera.—The only case where cuttings need disinfection in California is when they come from a region which is not known to be free from this disease and are to be planted in a vineyard which presumably is free from it.

The Phylloxera as it occurs in California is exclusively a root feeding insect, and the danger of introducing it on cuttings, even when these cuttings are taken from infected vineyards is very slight. The danger of introducing it on rooted cuttings is, however, very great if these have been rooted in a region where phylloxera occurs, and as there is no known certain means of ridding the roots of the eggs of the insect without destroying the plant, no rooted vines should be taken from a phylloxera infested region to one that is free from the pest under any conditions.

In certain seasons, in some years, many of these insects come out of the ground and lay their eggs on the above ground portion of the vines. These eggs hatch very shortly and produce the sexual insects which lay the winter eggs to which the danger of infection by cuttings is due.

The winter egg remains where it is laid all winter and does not hatch until the following spring. When the female insect prepares to lay the egg she crawls from the leaves and upper parts of the vine where it has been hatched, to the canes, follows these canes until it reaches a piece of rough bark where it can find the necessary shelter and deposit its single egg. As the canes of most vines are perfectly smooth and without crevices the great majority of the eggs are laid in the two-year-old wood near the base of the canes. A few of them, however, may be laid in the rough places found occasionally even on the one-year-old wood or under the bud scales in the same place.

As the eggs are so small that it is impossible to detect them in practice, some disinfection method is necessary that will insure the destruction of any winter eggs that might possibly be present. No cuttings which have a piece of old wood at the base should be taken as this much increases the danger of eggs being present.

The only method of disinfection which has been found safe and practicable is the proper use of bi-sulfid of carbon. The following extract from Bulletin 131, "The Phylloxera of the Vine," published by the Agricultural Experiment Station at Berkeley, will explain the method of operation. The time of treatment is a very essential factor. If treated for too short a time some of the eggs may escape, and if too long the cuttings may be injured. If the time is at least one hour and does not exceed five hours there is no danger from either cause.

The method of using the bi-sulfid is as follows: Place the cuttings in a barrel, vat, or box made tight by means of a thick coat of paint, or paper pasted on the inside. On top of the cuttings place a saucer or other shallow dish, into which to pour the bi-sulfid of carbon. An ordinary saucer will hold enough for a box 3 feet cube or a 200-gallon vat. For larger receptables it is better to use two or more saucers. Deeper vessels will not do, as the evaporation is not sufficiently rapid. After pouring the bi-sulfid into the saucer, cover the box with an oiled canvas sheet or other tight-fitting cover, and allow to stand for from forty-five to ninety minutes. At the end of this time there should be a little of the bi-sulfid left. If it has all evaporated this is proof that insufficient was used. No flame lights should be used, as the liquid burns easily and the fumes form an explosive mixture with the air. Care should be taken not to spill any of the liquid on the cuttings, as it may kill them. It is advisable to cut off about half an inch of the lower end of the treated cuttings before planting, as the vapor injures the open pith.

Besides disinfecting the cuttings in this way, all the packing material in which they come should be burnt, or, if valuable, dipped in boiling water. Practically, it is impossible to disinfect rooted cuttings satisfactorily on account of the difficulty of killing all the phylloxera without seriously injuring the vine roots.

PROF. F. T. BIOLETTI.

A DEADLY GOPHER DISEASE.

Official experiments were made in France to test the value of the "Danysz Virus" for the destruction of gophers; —the results were highly satisfactory. The "virus" gives to the animals a disease similar in character to typhoid fever, the animals die in five days. The disease is very contagious and in two weeks 95 per cent. of the gophers in the fields treated are dead. This was determined by plowing up these fields and making a count of the dead gophers; in one hole 15 dead animals were found.

The treatment is applied as follows: To 36 quarts of water 3.5 ounces of salt are added; when this is dissolved 12 bottles of virus are added. 200 lbs. of oats are then sprinkled with this solution and the mass thorougly mixed by shoveling with a wooden shovel (not a metal one). Only the amount needed for the day's work should be mixed. A gang of men are provided each with a wooden pail full of the mixture which is spread all over the field, but especially at the entrance of holes. The amount of grain used may vary from 4 to 24 pounds per acre according to nature of crop and number of of gophers. One man can treat 6 acres in a day of 8 hours using 32 pounds of grain. The cost, not including labor is 40 cents an acre. The treatment is applied in the spring of the year.

ORANGE-GROWERS have discovered by actual tests that a fertilizer containing not less than 12 per cent. of POTASH (in the form of sulphate) insures the most abundant yield of finest fruit.

Our books on successful fertilizing are free to you, without cost or obligation, if you will write for them.

TREES

CALIMYRNA FIG

There are a great many sorts of Smyrna Figs. We eatalogue six kinds, but these do not eomprise our entire eollection. There is only one variety, however, whieh five years production on a commereial seale warrants us in reeommending it for drying purposes, and this particular variety we have designated as above to give it the distinetion it deserves. When you buy your trees from us, you know you are purchasing stoek originating from pedigreed trees, whieh have been produeing the highest grade of fruit for a period of years. When you purehase a thousand peach trees, you usually designate what you want. You eertainly would not permit your nurseryman to send you a lot of varieties, without labeling them, if you eould help it. Well, it is the same with the Smyrna fig, some are early, others late, some are purple, others green. Can you afford for the sake of saving a few eents to take chances on buying trees, which eannot be relied on. We were the first ones to demonstrate the value of this fig, and with our seal we guarantee the genuineness of our trees. Priees lower than ever before.

FRUIT TREES

Are grown on a deep, alluvial river bottom, virgin soil, eonsequently the root system is as perfeet as good soil ean make them. Our assortment of apples, pears, peaehes, prunes, apricots is more eomplete than ever.

ORANGES AND LEMONS

Our stoek is grown in Exeter, the famous thermal belt of Tulare County. The soil is a rich, deep, black loam, just the kind which develops the highest grade of fruit, as well as the most perfeet type of tree. Our assortment eonsists of all standard varieties of Oranges, Lemons, Pomelos, Citrons, Limes, etc. Carrying out the lines already established in the other braneh es, we do not eonfine ourselves to one or two standards and no more, for although it costs money to keep up a stoek of many varieties, we want to be on top in this, as well as in everything we specialize in the nursery business.

GRAPE VINES

If you do not know it, you ought to know that we are the largest growers of vines on the Paeifie Coast. We are not only growers of raisin, wine and table grapes, but we are also making a speeialty of vines grafted on Phylloxera resistant roots. Our great and enterprising neighbor, Mexieo, is having its vineyards devastated by this pest, and we have already sold two orders to prominent vineyardists there, who know what our stock is, consisting of eighty thousand grafted vines. How did we get such orders? Beeause we had pleased our eustomers before, so they had no hesitation in patronizing us again.

ORNAMENTAL STOCK

Our stoek of Texas Umbrella trees branched in all sizes, guaranteed absolutely true to name, is better than ever. We are extensive growers of Poplars, Mulberries, Maples, and all deeiduous ornamental trees suited to our eonditions.

In evergreens, we have Aeaeias, Euealyptus, Palms, Roses, Greenhouse plants, in fact everything you want for your garden.

OUR NURSERIES

Eleven hundred acres in four distinct plaees. Expensive to run a business so widely distributed. We konw it. Why do we not eoncentrate all in one plaee? Because we want to be in the position to grow the best of everything, and to do this, must select the soil to suit the tree, shrub or vine. No use to grow a tree where you know beforehand the eonditions are not favorable for its perfect development. That is what twenty-one years of experience does. It places us in the position to grow the very best stock. In making a plea for your trade, we do so, not because we have the cheapest stoek, but on the ground that when you favor us with your business, you will get the best which money, brains and experience combined ean grow.

CATALOGUE

We will mail our large profusely illustrated Catalogue. English or Spanish, to any address on reeeipt of 5e postage. Priee-list mailed on application.

PAID-UP CAPITAL, $200,000.00.

Irrigation and Pumping

TEACHINGS OF EXPERIENCE IN IRRIGATION.

It is likely that irrigation has been practiced ever since the wants of man could not be supplied by the natural production of the uncultivated land, as the earliest writings mention the pouring of water on thirsty land, and there are remains of ancient irrigation works in various parts of the world, as in Egypt and the valley of the Euphrates, which likely are older than any written history. Even in our own country there are remains of canals in Arizona which were made by some pre-historic race.

The irrigated area of the world has gradually grown until it now covers possibly 60,000,000 acres, of which India has more than half and the United States about one-eighth, being second in number of acres.

The meaning or irrigation to the farmer is the method of applying water to the land so as to produce the best results witth the least amount of labor and water. The statesman views irrigation as a means of bringing waste land under cultivation, so as to sustain a dense population on territorics that are otherwise practically a desert. The people generally arc interested because they are the owners of the public lands, and with irrigation these lands may become more valuable as well as more productive. In this way every individual as well as every locality is more or less interested in irrigation.

An adequate and perpetual water supply must first be secured before it will be wise to undertake any considerable outlay for other improvements on land, for in case the water supply should fail at any time the entire labor and previous expenditure of money may be a total loss, or if not entirely lost the returns may be so small that they will not be profitable. It is almost useless to undertake fruit growing without plenty of water that can be obtained at such time as the trees need it. Grain can be grown with a less certain water supply, as the water can be applied early in the season when water is usually plentiful and the crop may mature without further irrigation.

Alfalfa will need a much larger quantity and the supply must be at hand as often as needed in order to produce the best results. Vegetable growers need water in smaller quantities but at much more frequent intervals.

The quantity of water needed varies with the soil and climate. In some places a constant flow of one miners inch, .02 second foot, or nine gallons per minute is sufficient for ten acres. This means a depth of 8.8 inches from May to October, inclusive, or 17.6 inches for the season in addition to the natural rainfall. This will be sufficient for citrus and deciduous fruits if there is a rainfall of 15 inches which is evenly distributed, but it will not be at all satisfactory if alfalfa growing is attempted. In other places as much as one miners inch to five acres is required.

In estimating the amount of water needed the seepage of canals and the evaporation from reservoirs must be taken into consideration. If canals have cement lining the seepage will be reduced to the minimum, which in some cases is as low as 6 per cent of the supply, while in dirt ditches the loss sometimes reaches one-half of the amount turned in at the head of the ditch.

Evaporation from reservoirs varies greatly under different conditions. It has been determined that with a wind velocity of five miles per hour the evaporation is 2.2 as much as it is in still air, and that with a wind velocity of 15 miles per hour the evaporation is increased near five times. Evaporation decreases with increase of altitude because of lower temperature, so it will be seen that reservoirs in the mountains where they can be protected from wind are to be prefered to those on the warmer and more open plains. Evaporation from water fully exposed varies in the western part of the United States from about 18 inches on Puget Sound to 100 inches during the year at Fort Grant, Arizona, and Keeler, California. The evaporation from ordinary soil is about the same as from water, and from sandy surfaces is about one-third as much as from water. A covering of any kind greatly affects the amount of evaporation. When the evaporation from bare uncultivated ground is called 100 the evaporation from sand will be 33 per cent, and from ground well covered with forest leaves only 10 to 15 per cent. A covering of finely pulverized earth is even better than any other covering, showing the value of thorough and frequent cultivation.

Proper drainage is also needed where irrigation is practiced, and where the soil is not sufficiently porous some system of drainage must be provided, otherwise swampy places may be formed or alkali salts brought to the surface and the fertility of the fields destroyed. Care is also needed that the soil may not be leached by excessive application of water.

Several methods of applying water to the land are in use, depending on the needs of the soil and the convenience of the irrigators. Where large fields of alfalfa are to be irrigated with a large water supply, contour basins are frequently made to contain from 5 to 40 acres in one basin. Where the water supply is smaller and in orchards, the irrigating is done either by means of basins from 10 to 50 feet square, which are filled to a desired depth, or in furrows from 3 feet to 6 or 8 feet apart in which the water is allowed to flow until the land is sufficiently wet.

According to statistics the average cost per acre of the irrigating systems in California is $10.30 per acre, and the average annual cost for maintenance is 69 cents per acre. This does not include the systems which are supplied by pumping. These are often expensive, and a cost of $50 per acre is not consideded excessive for the installation of pumping plants and ditches.—J. B. NEFF, before State Farmer's Institute at Berkeley Dec. 28, 1905.

The Colorado River, says the Imperial Press, must be our servant, not our master. Its yellow flood must fructify and bless, not overwhelm and destroy. The day will soon dawn when the great turgid flood will be powerless to harm us, and the Colorado River will be put to the highest use of which it is capable.

A new and extensive oil refinery is to be established at Santa Barbara.

EVERY FARMER KNOWS

that it is necessary to use fertilizers; the only question is as to the method of applying them to the soil.

THERE IS NO QUESTION

in the minds of those who have ever used the ***Buckeye Fertilizer Drill*** that it is absolutely the best for the purpose. Especially adapted for use in Orange Groves. It puts the fertilizer where it will do the most good, saving time, money and labor. We also have the ***Buckeye Grain Drills***—nothing better on earth. Write to us or call at our new store.

WE ALSO SELL

the ***John Deere Plows and Harrows.*** Better than ever.

CITRUS FRUITS

By C. A. Day. Pasadena

WASTE AND DETERIORATION OF A MATURE ORANGE CROP.

A maturing orange crop runs the gauntlet of many dangers and adverse influences which beset it at every stage of its development, causing a certain percentage of waste and deterioration of quality, as follows:

Fungus or rot, split oranges, puffing, smut or fungus from the presence of black scale, scarred fruit from various causes, severe dropping in the spring just prior to the blooming period, injury from wind, and injury from frost.

All these various influences cause waste and deterioration in some cases the loss from these changes the balance from the profit to the loss column of the ledger. It is important for us as growers to carefully go over this list and see where we can avoid loss.

In most instances where navel oranges are dropping at this time of the year it will be found, on examination, that there is a black spot in the interior of the orange near the navel end, the result of fungus and decay which has attacked the orange while yet on the tree.

The spores of the fungus which have gained an entrance to the interior of the orange through the navel causes the decay. This fungus is the same which causes decay of oranges while in transit to market. The spores of the fungus, which float in the air, come from decaying fruit. It would therefore seem a safe course to allow no decaying fruit to remain on the ground under the trees. Every year there is a percentage of loss from split oranges. This year in some orchards there have been a great many split oranges.

There are theories as to the cause but investigation by the pathological station to be established will be beneficial in determining the cause and finding a remedy.

Puffing of oranges is not showing up as bad this year as in the last two years. The condition of the trees in general is normal and except upon heavy subsoils, where the subsoil has dried out, I do not look for very much puffing. The failure to supply sufficient moisture at all times to the root system is probably the cause of most of the puffings. The smut on the oranges may be prevented by keeping the trees free from black scale. The smut prevents an even coloring of the fruit and adds the cost of washing to the expense of preparing the fruit for market and also increases the chances of possible decay in shipment. It also lowers the grade of the fruit when not thoroughly removed.

* * *

Scarred fruit.—The scaling of oranges is due to different causes. Thrips are responsible for disfigurement of much fruit. There is considerable loss from scarred fruit on the trees, the result of crowding the trees in cultivating and from an excess of dead wood in the interior, which scars the fruit in the case of wind. These scars are frequently made when the fruit is green by crowding the team too close to the tree and also the cultivator running too close. A badly scarred orange will only grade standard when otherwise it would go choice or if free from injury, fancy. This means a loss of from 20 to 50 cents per box.

* * *

Injury from frost.—There have been some frosty nights during December. Orchard trees with new wood well matured are in the best possible condition to resist damage from frost. Fruit on old trees with heavy foliage will be in a measure protected from injury except in extremely frosty locations. Fruit on young trees and old trees with scant foliage will be much more susceptible to injury. In frosty locations fire baskets in the orchard are beneficial and will often save many times the cost of the baskets and fuel. Young orchard trees, where there is not sufficient top to protect the trunks and larger limbs from the frost should be wrapped with sacking. In some years an orchard or citrus nursery will escape injury because of a current of air, but it is not safe to trust to such a chance. With the last two years practically free from frosts the grower becomes careless, and with a sudden drop of the temperature he is caught unprepared. The result is serious injury to fruit and wood. It is best and safest for the owner of an orchard located in the frosty belt to always be ready for the unexpected.

* * *

Protection of citrus nurseries.—Some of our citrus nurserymen cover their nurseries with lath. When nursery stock brings good prices this is often a good investment. Fire baskets have been used in citrus nurseries, and in many cases have saved hundreds of dollars to the owners. Nursery stock frozen so as to burst the bark of the bodies of the trees is practically worthless, although such stock is often sold to inexperienced persons.

The Imperial Press and the Coachella News speak enthusiastically of Mr. Neff as a presiding officer of the week's course in the valley as highly successful in point of interest and instruction. The Compton institute was also very successful. Messrs. Ward and Barron and Hearne are a host at these institutes. They should travel with Conductor Neff through the district.

The Riverside Press says: Dale district has always been regarded as typical a desert as was to be found outside of the Salton basin before the latter became a sea, so it will surprise the general public to learn, that owing to the excessive rainfall last season and a proportionate amount thus far for this season the agricultural interests of the district are second only to the mining interests.

FLORICULTURE AND GARDENING

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

FLORAL CALENDAR FOR JANUARY.

Those who have not planted spring flowering bulbs should put them in at once if they expect to grow any.

For early blooming, seeds of the following may be planted, especially during the latter part of month: Arctotis (a grand annual and too little known), asters, Dianthus (pinks), phlox, salvias, stocks, sweet peas. The latter should be sown once a month if you have room for a procession of these beautiful flowers.

AGRICULTURE IN RURAL SCHOOLS.

The greatest drawback to managing school gardens comes from the absence of the teacher and pupils during part of the summer season. Some one will be needed near each school who will assume the care of the garden during the vacation and who will consult with the teacher when there is a change from one teacher to another.

If we can get all interested to work in introducing agricultural leaflets and text books into our rural schools; if we can have hung on the walls of the country school house charts relating to the interesting and important in farming and farm life; and if we can get our teachers to instruct in these nature studies, we will have in the future a greater state horticultural society and a greater state agricultural society. The introduction of agriculture and nature study into the rural schools will bring more students into the state and agricultural college, and will not only build up technical knowledge but will build up a better civilization on our farms and in our state.

The trained rural school teachers have an abundance of interesting material for nature study near at hand. They have the farmers' homes, the fields, gardens, school ground, lanes and woods. If we will only educate teachers how to use their eyes and give them some helps so that they can teach their pupils interesting facts, they can start the country boy and girl on the road to an appreciation of the beauty of the country, the interests of the farm and the joys and duties of home making. What we need to do, more than all else, is to get more men and women who are in touch with agricultural science and agricultural education, and with home economics, to turn a portion of their attention to the rural school. They will be able to give us the reading books, the charts, the remodeled text books and the outlines for experiments and observation exercises which are needed.

EASILY GROWN SUCCULENTS.

Aloes, gasterias, haworthias and kindred plants are usually grown with a collection of cacti, to which they make good companions, and are of easy culture. The soil should be of a mixture of sandy loam, allowing, as in all cases of potting succulent plants, a thorough drainage. They thrive nicely in a sunny position during winter with little watering, whilst in summer they seem to thrive best when shaded somewhat and watered freely.

THE CANARY ISLAND PALM.

The most popular palm throughout California is no doubt the "Ornamental Date" or Canary Island date (Phoenix Canariensis). While it grows best with a goodly supply of water, it is, after being thoroughly established, quite drought resistant.

Canary Island Dates at Stockton.

It thrives in the heavier adobe no less than in the purest sand, and no soil in California has proven greatly unsuited to its successful growth. In many places it may be found a rich healthy color, when few other plants could withstand the heavy percentage of alkali present in the soil. No mistake will be made by giving this palm a place in the garden.

The Chinese Chestnut (Xanthoceras Sorbifolia), which is an ornamental deciduous shrub with a dark green glossy foliage and a very light pink showy flowers, is giving satisfactory results. This shrub has a roundish outline and grows slowly. It blooms very early and freely in the spring, making it a desirable early flowering shrub.

TRAIN THE CHILDREN.

To train children in rural improvement ideas means to train children to see, to observe the beautiful in nature, to become interested in plant life. It means to awaken in the child mind a desire to have a plant, a tree, or a garden of his very own, where he can study out the mystery of "how to make things grow." When we have interested the individual child in the individual plant we have formed a nucleus for rural improvement ideas, which may unfold into an association for creating "beautiful homes" on the treeless lands of the yet unreclaimed deserts.

Our public schools are doing a great deal with their nature studies to interest children in rural improvements, but to the parent should the child be indebted for its first lessons in the industry of tree planting.

Children naturally love to do things, but they do not love drudgery, and that which we are compelled to do becomes drudgery. How many boys have been driven away from the home farm because their fathers insisted on working them, instead of allowing them to work. How much better if parents would lure their children to industry by companionship and pleasant stories, especially about plant, animal and insect life found everywhere about them. No parent is so well posted but he may learn much about these things while instructing the children.

THE GARDEN BOY.

A nobleman once insisted on his head gardener taking as an apprentice a young man in whom he was interested. The lad was very lazy, and the gardener was not at all pleased at having such a youth thrust upon him.

Sometime after his lordship, walking in the garden, came upon his gardener and said:

"Well, John, how is my young friend getting on with you?"

"Oh, he's doin' fine!" replied the gardener, with a smile. "He's workin' away there at the very job that suits him. 'E's a-chasin' of them snails off'n the walks."

The Chaste-tree (Vitex Agnus-Castus), commonly known as Mint tree, is an ornamental deciduous tree. It has an irregular habit of growth and branches in every direction. The leaves are digitate or divided like a hand into five to seven finger-like leaflets. The tree blooms until frost. It produces many spikes of lilac to blue mint-like flowers. Both the leaves and flowers produce a strong scent, which at times is likely to be disagreeable. Most of the Vitex family are inhabitants of warmer climates, but this species is hardy in this region. Aside from the odd foliage it does not seem to have any other striking feature.

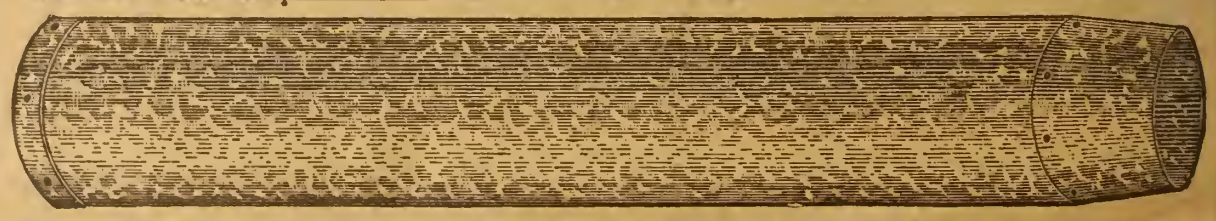
PRESIDENT—J. M ELLIOTT. VICE PRESIDENTS—STODDARD JESS, W. C. PATTERSON, GEO. E. BITTINGER, J. S. CRAVENS CASHIER—W. T. S. HAMMOND. ASSISTANT CASHIERS—A. C. WAY, E. S. PAULY, E. W. COE, A. B. JONES.

First National Bank, Los Angeles, Cal.



TALLERDAY SURFACE IRRIGATION PIPE

SAVES WATER, GRADING AND TIME

The *only* way to *Irrigate Alfalfa. Cheaper* than *Flumes.* This is only *one* of our *specialties.* We make *Riveted Water Pipe* in lengths of *Ten Feet* from *Single Sheets.* Let us *prove* to you that we make *Pipe* and *Tanks Right.* WRITE FOR CATALOGUE.

TALLERDAY MANUFACTURING CO.
210 No. Los Angeles St. Los Angeles, California

Minnewawa Home Packing Co., Fresno, Cal., Agents for Fresno and Tulare Counties

In the Vegetable Garden

VEGETABLE CALENDAR FOR JANUARY.

The planting of vegetables will be on the increase now for several months, the lowest ebb being reached during the present month, while the period of much activity is during March and April. If we have heavy rains, followed by several severe frosts during the first part of January, it will be safe to plant many things during the period from 15th to 30th that are not in the following list:

Sow of seeds—Beets, beans, broad and bush varieties, not pole beans; cabbage, early; carrots, cauliflower (our favorite flower); lettuce, parsnip, peas, radish, spinach, tomato.

Plant sets, roots, or plants of—Asparagus, horseradish, onions, rhubarb.

If warm the latter part of the month in sheltered or favored localities early potatoes may be planted.

STORING SWEET POTATOES.

The following is taken from Press Bulletin 126 of the Oklahoma Station:

The sweet potato is very easily injured by rough handling or by being cut or having the skin broken, and great care should be taken in digging and handling the crop. All potatoes injured in any way should be marketed at once or fed to the stock. Loss from disease in storage is great enough when all precautions are taken. The potatoes must be kept dry and placed in storage at once. It is not necessary that they be placed in a cool cellar, but they should be handled no more than necessary.

There are three fundamental conditions that must be met in order to be successful in keeping sweet potatoes. Potatoes stored must be healthy and free from bruises and cuts. The potatoes must be dry when stored and kept dry while in storage. The temperature of the storage room should be kept between 50 and 65 degrees F. The first condition can be met by careful sorting before storing and by keeping the storage house free from rats and other vermin.

The second condition named is the most difficult to meet. A very good method is to keep the temperature of the store room up to 90 degrees for about a week as soon as the potatoes are stored, and at the same time give good ventilation. This is sometimes called the sweating process. Potatoes dried in this way are said to be kiln-dried. If this process is not convenient, a good method is to give all the ventilation possible so the potatoes can dry very rapidly for about two weeks. It is necessary to guard the ventilation and permit only dry air to enter, as moist air will deposit its moisture on the cool potatoes and this will produce the best condition for the potatoes to begin rotting. The storage room must be dry, very few cellars meet this requirement. The ventilation should be just sufficient to keep the air pure and the potatoes dry. The condition of temperature should be provided for in the construction and location of the building.

Small quantities of potatoes can be kept by storing them in dry sand or road dust, and old time practice of piling the potatoes on the ground and covering them with straw and litter and then with soil is too often a failure to be recommended.

SAVING CANTELOUPE SEED.

The best canteloupes for seed must come from a field where the general type was good. It must be of the proper size; the netting must be fine and closely laced. The space between the slight ribs must be smooth and well defined from the stem to blossom ends. The ribs must be all of equal width. The blossom ends must be well strengthened by a small raised button, and the weight should be nearly 1½ pounds. Then the color should be a light gray, showing a very little orange between the netting. When cut, the meat should be light green, changing slightly toward yellow at the center, fine grained and deep, so that there remains but a very small seed cavity.

Montreal Market Musk Melon.

RHUBARB.

The culture of the common rhubarb in no wise differs from that given in other states except that our dry, hot summer climate makes it tougher and more fibrous than it is elsewhere and therefore a partial shading is desirable. In spite of this it is grown in the open from the sea to the desert, though never so succulent as it becomes east of the Rockies. The time to plant the roots is now. Two year roots will give a crop the present season. When well established the plant is a gross feeder—keep the bed mulched with strawy manure.

Of late years in this State nearly everyone has abandoned the old-fashioned, summer-bearing sort for the Crimson Winter from Australia, which was introduced here by Luther Burbank.

MEDICAL PROPERTIES OF VEGETABLES.

Diet instead of drugs is becoming a more and more popular method of medication as we become more aware of the beneficial effects of the various plants and fruits on the system, and it is certainly far more agreeable to eat a fine ripe orange or a delicious peach than to take a dose of blue mass or to fill your system with calomel. A late issue of "What to Eat" says that if people understood the medical properties of the foods they would use them more for physical ills and the doctors would have to go to something else for a living. For instance, spinach and dandelion are good for kidney trouble; celery is good for rheumatism, nervous diseases and dispepsia; lettuce and cucumbers cool the system, and the former is good for insomnia.

If you want to perspire freely, to relieve the system of impurities, try asparagus.

There is nothing, medicinally speaking, so useful as the poor and humble onion. They are almost the best nervine known, and may be used in coughs, colds, and grippe, in consumption, scurvy and kindred diseases. White onions overcome sleepliness, while red ones are an excellent diuretic. Eaten every day they soon have a whitening effect on the complexion.

For erysipelas and malaria nothing is better than cranberries.

Fresh carrots and yellow turnips are good for scurvy. Carrots for asthma, watermelon for epilepsy and yellow fever; lemons for feverish thirst in biliousness, low fevers, rheumatism, colds, coughs and liver complaints.

Eggs beaten up raw with sugar are used to clear and strengthen the voice, while with lemon and sugar the beaten white of an egg may be used to relieve hoarseness.

CANNED SPINACH.

Spinach is a canned vegetable new to our markets for one or two seasons and meets with the hearty approval of the trade. This salad comes out of cans with its flavor and succulence unimpaired. The goods, so far as we have seen, have come from eastern canning centers.

FERTILIZING VEGETABLES.

All beans, peas and similar pod-bearing plants, respond freely to fertilizers rich in phosphate and potash. The turnip and all bulb-making plants relish nitrogen above all other forms of plant food.

Strawberry Plants

200,000 Excelsior Strawberries, from plants of R. M. Kellogg Co. last spring. Address
F. S. Lee, Pasadena, Cal. Phone Main 922

"Al" or Enhance Strawberry Plants for Sale

First-Class Stock
D. F. Reichard - Irwindale, Cal.

LAXTON'S NOBLE STRAWBERRY PLANTS

35c per 100, $2.00 per 1000. Order before Jan. 1st
THE HOUSTON BERRY FARM
235 Colton Avenue - - Riverside, California

Berry Vines

Logan, Burbank's Mammoth Black, Phenomenal. Prices on application
Isaac Martin Merle, Cal.

BRANDYWINE PLANTS

Brandywine Strawberry Plants for sale, Kellogg's strain. No better nor thriftier plants grown. Clean of all disease; at bottom prices.
G. W MULLENDORE, COVINA, CAL

IMPROVED GARDENA DEWBERRY

And all other kinds of Berry Plants. Nursery Stock for sale.
A. R. Rideout, Magnolia Nursery, Whittier, Cal.

Berry Plants

Brandywine Strawberry, Cuthbert Raspberry, Crandall Blackberry and Loganberry Plants.
Toluca Nursery. Toluca, Cal.

Vigorous Strawberry Plants

For Sale. 100,000 Excelsior and 300,000 Brandywine. Stock direct from R. M. Kellogg last April. Also Red Raspberry Plants.
R. De Young, R.F.D. No. 1, Pasadena, Cal.

BURBANK'S
Crimson Winter Rhubarb
OUR SPECIALTY
$1.50 per dozen, $7.50 per 100, $50 per 1000
WAGNER'S NURSERY
PHONES { Home, 1291 / Sunset, Black 1297 } Pasadena, Cal.

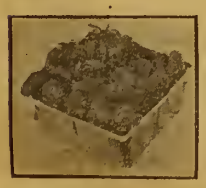
BERRY PLANTS

100,000 Brandywine Strawberries (Kellogg strain) 3.00 per 1000. 50,000 "A1" Strawberry Plants, $3.00 per thousand.
50,000 Gray's Gardena Dewberries, $8 per 1000.
Raspberries, $8.00 per 1000.
Loganberries $8.00 per 1000.
All raised on virgin soil and first-class plants.
A. E. HARRINGTON
R. D. NO. 6 LOS ANGELES, CAL.

STRAWBERRY PLANTS
(TROPICO BEAUTY)

The very best Brandywine stock at low prices for sale by the grower,
D. Griswold, Box 25, Tropico, Cal.

BRANDYWINE "A1" STRAWBERRIES

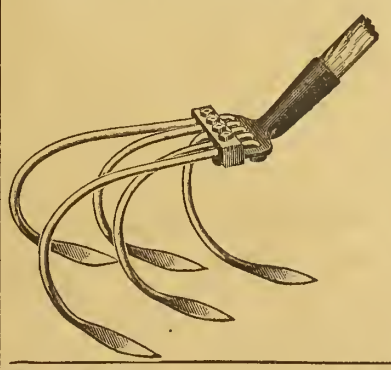


250,000

Strong Growing, Thrifty Plants for sale. Brandywine Plants direct from Kellogg Strain. The "A 1's" are the newest and best introduction of fall bearing berries known.

Frank P. Baldosser, Covina, Cal.

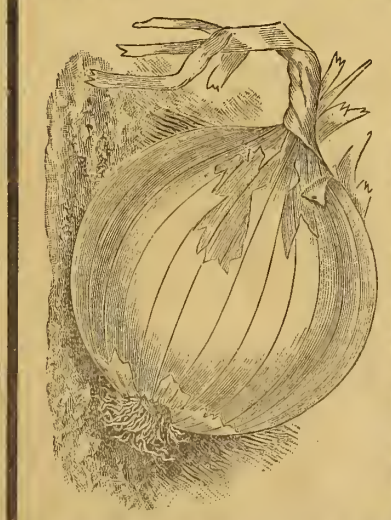
ADJUSTABLE GARDEN CULTIVATOR



THE NORCROSS
An Adjustable Garden Cultivator of Five Blades
And Five Reasons Given Why it is Best Hand Garden Tool on the Market.
OVER 100,000 IN USE.

1. It is the LIGHTEST, weighing but 3 lbs, complete with handle.
2. It is the STRONGEST, as the blades are forged out of a solid steel rod.
3. It will pull out the weeds and pulverize the ground thoroughly, leaving it level.
4. It is ADJUSTABLE in width by sliding the top plate.
5. It will work between rows or center shovel can be removed and straddle row.

IRA D. BROWN
Western Distributing Agent, San Fernando, Cal.



C. C. MORSE & CO.
THE WELL-KNOWN
Seed Growers
FORMERLY AT SANTA CLARA, ARE NOW LOCATED AT
815-817 Sansome St., San Francisco

and are prepared to sell their seeds in any quantity, whole-sale or retail.
Headquarters for *Onion* seed and all kinds of vegetable seed.
Also *Sweet Peas* and all kinds of flower seeds.
Also *Alfalfa* and all kinds of farm and field seeds.

Seeds of the Highest Quality Only

The Closing Year.—The year which will close Sunday at midnight has been memorable for its achievements. It will go down in history as one of the most strenuous, in point of things done, of any year in the past quarter of a century.

To begin with the year has been phenomenal in what has transpired. The marvelous era of prosperity which has attended the nations of the earth, with one or two exceptions, for a decade previously made 1905 the apotheosis of gigantic commercial endeavors.

In our own country especially, the greed for gold marked the life of the people. In every avenue of trade from the little shop-keeper to the merchant of princely fortune, the strenuous effort has been to accumulate wealth. We have lived in, and breathed an atmosphere of commercial acquisitiveness, and so strongly has this thought taken posssession of our life and energy that it has been the ruling, the one absorbing idea of the period. Not with in the memory of man have so many vast fortunes been combined, in a single year, as are shown by the records of 1905 to have been collected. It is true there had been understandings, and secret alliances and trade relations which amounted to "trusts," but they had not assumed the boldness of action, nor the defiance of the law, that marked their course in the early months of the year, now coming to a close.

So powerful had become the railroad and insurance companies, the Beef trust and the Standard Oil, that they seemed to be able to say to the people and to the government, even, what are you going to do about it? Apparently they had the "strong grip of the lion's paw" on the entire country, which was made to pay tribute to their treasury, and the State and the officers thereof, were reluctant to exercise the authority they possessed to check the insatiate greed of these despoilers of the people's rights lest they should lose their positions.

But men there were born to fight unlawful combines of capital, which had become the enemies and oppressors of the public, as men have risen up in the olden days to strike down the tyrants of human rights. Roosevelt, Jerome, Folk, and a hundred other less illustrious lights, came to the public rescue and with them stood the courts, and behind them lined up the masses of the common people, demanding that no guilty man should escape who had been a conspirator against the State or who had robbed and plundered the public.

So there has been scurryings to and fro, the Rockefellers, and Hydes and Hammels, each mighty in his own world of finance, have "taken to the woods, while the Mitchells and Burtons have felt the heavy hand of the law laid on them by reason of the wrongs they have committed, the one dying from shame of disgrace, the other standing on the threshold of the penitentiary with its doors ready to close behind him. From the Senate of the United States to a sentence in the penitentiary is a climax never before witnessed in this country in a single year in the lives of two of its members. Mortifying to the public sense as these distressing incidents are beneficial results have come out of them for the people.

The railroads have been taught that unfair rebates and usurious traffic contracts can not be maintained against the announced doctrine of the President, that every citizen of this Republic shall have a "square deal."

The Life Insurance companies have been so thoroughly shaken up that it would appear we are on the way to make them honest and of lasting benefit to the country.

The ornamental appendages like Depew, and Hyde, and McCurdy, have been pruned away and before the close of 1906 we shall see, we believe, an honest system of life insurance inaugurated, which will prove a blessing and not a curse to investors in life insurance policies.

Coming down to our own State we have vindicated the law in the punishment of boodlers, who were sent to Sacramento to make our laws. Let all California be glad. So may we deal with dishonest officials, wherever they may be found. May the fate of the four State Senators, convicted of accepting bribes, serve as a constant reminder to persons of like disposition, that the mills of the Gods grind fine, when dishonesty in public life is fastened on the individual.

California has many things to be glad for in the record made in 1905. What strides in population we have made; in general, how excellent the morale of the people who have come among us to abide. Then too, we have grown within ourselves. Our industries have developed at an unthought-of magnitude. We are converting the deserts into habitable places and within a few years we shall have water enough in the State to make it possible for four times our present populaion to live in California and be prosperous..

In point of financial strength the State has gone forward by leaps and bounds during the year in a manner undreamed of. More money has come into the pockets of the citrus growers than in any one year in the memory of those engaged in this industry.

Space will not permit further consideration of this subject. We are all proud of the record made by California in this year of years, and as we turn our faces to the morning of the New Year with hopes and aspirations high for the greatness of the achievements we confidently believe will come, let us move steadily, courageously forward, doing all we can to make 1906 eclipse, in all that is good and great the wondrous record of 1905.

* * *

The Lesson of the Season.—"We all do fade as a leaf."

The lesson conveyed to us by the killing frosts of the past week and the consequent change in the life of vegetation, the flowers, the leaves on the trees, the tender plants which have since faded and now are dying, is one the individual who takes notice of nature and its laws cannot help but be touched by.

Eight or nine months ago the trees which adorn your lawn and grow in your garden took on new life. The bushes which have since flowered so beautifully about your door have grown on uninterruptedly amid the sunshine and the shower, until they became the delight of your eye and the glory of your home. With eager eye you watched the daily process of unfolding, and rejoiced when the fullness of their beauty came. When the last bud had been opened and the last leaf, in all its beauty and symmetry had been spread, not only as a garment for the tree, but as a toy for the wind and a target for the sun, you gazed long at the delightful spectacle, marvelled at the delicate handiwork of Nature, and recalled the rapturous words of the ancient—"He hath made everything beautiful in his time."

To day a different spell has been cast upon the scene. Whenever the frost King has spread his icy hand. There is a flash like the change of autumn upon the leaf and the Lilies, and the Poinsettia and the tender plants have dropped their heads and are a thing of beauty no more. Dissolution has set in and soon you will stand by your window to note that shrub and plant where the frost touched them and even trees have been shorn of their last vestige of beautiful raiment—deserted by the birds which loved to carol in their branches and now stand dreary and alone amid the glorious changes of the season under a California sky.

Hence the significant imagery of the inspired writer appeals to us, and there is an inward assent to the sentiment expressed—

"We all do fade as a leaf."

We are taught, however, that the leaf which falls to the earth and mingles with its dust in due time emerges therefrom in a new form of life.

In this teaching man finds an abiding comfort. It tells the story not of an eternal death but of the hour of transformations, when bidding farewell to earth he passes to the realities of a new world.

We may fade like the leaf, but like the leaf we shall come to "newness of life" again.

Job, in one of his wonderful soliloquies, says:

"If a man die, shall he live again? All the days of my appointed time will I wait till my change come."

In the change through which the leaf today is passing by the touch of the icy finger of winter we learn of the change which awaits us all.

"Falling leaf and fading tree,
Lines of white in a sullen sea,
Shadows falling on you and me."

Then, in the afterwhile the eternal springtime.

* * *

Fruit and Nut Diet.—Physicians in California are discussing the diet question again, and it seems from their papers that they regard the proper diet for this climate fruits and nuts.

For several years past our most learned doctors have advised against eating pork or beef in any considerable quantity, as beef produces uric acid which in turn creates rheumatism, and pork acting on the blood and skin creates eczema and other skin troubles.

If meat is to be eaten, mutton or game is recommended, although fish, broiled, and chicken come in for as meats "fit to eat."

There is no doubt of the fact that we eat too much meat. The American people as a rule do it. We have been educated in the eastern and middle States to meat eating because it used to be cheap and was considered necessary, is that rigorous climate.

But out here where we know no zero weather the utility and advisability of strong diet becomes a debatable question. The system can not carry so much solid matter in a climate where exercise is not taken to keep the body warm. We all know from experience that a meat meal produces a "full stomach" which carries with it the sensation of uneasiness, and that uneasiness is nothing more than indigestion—which is the source of most of our bodily discomforts.

The fruits and nuts grown on the Pacific Coast, when eaten slowly and thoroughly masticated, the fruits cooked, when they can not be eaten without, will revitalize the stomach in a few months until all forms of dyspepsia will disappear and the victim of earlier indiscreet meat eating will feel like a new person.

* * *

This has been a year of great prosperity for the Cultivator, but it will beat the 1905 record next year.

* * *

Happy New Year to all the Cultivator family.

* * *

In all that is good California affords the best.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

The Tussock moth, commonly known as the horned caterpillar, is a pestiferous pest that threatens to add to the orchardists' troubles.

There is a movement on foot among the fruit growers of Clarkston and Assotin to erect a large warehouse near the business portion of Clarkston.

Orange shipments from Redlands and from all Southern California points are now considerably in excess of the output to this date last year.

At a meeting of raisin growers of Fresno, it was resolved to stand by the directors of the Raisin Growers' Association and turn down Mr. Kearney's propositions for reorganization.

The high winds of last week, says the Free Press, destroyed the olive crop of the Ventura Agricultural Company near Somis rendering the olives unfit for pickling though some of them may be used in making oil.

The Alta Advocate tells this pleasant bit of news about one of its county citizens: "J. H. Williams, a Porterville orange grower, picked 32,000 boxes this year. His profits on this crop were enough to make him rich."

One nurseryman at Hanford states he has sold enough trees to plant 1800 acres of Kings County soil to orchard. The varieties are principally peaches, apricots and apples. He can still supply customers with trees from 3 to 4 feet in height.

The orange crop at Moreno this year is estimated at about 145 cars, of which probably 125 cars will be packed at Alessandro and the balance hauled to Riverside or Highgrove. Last year 117 cars were packed at Alessandro.—Perris Progress.

An active campaign against the Tussock moth is soon to be waged by the horticulturists throughout the state. Experiments on a large scale to find a suitable remedy that will eventually destroy the pest will first be tried in Santa Cruz County.

The Chino Champion remarks: "If the olive producers in this state would organize and raise a fund for advertising the oil, there would soon be a greater demand for it than they could supply, and it would soon drive the adulterated European article out of the market."

The executive committee of the Raisin Growers' directorate at Fresno, this week, adopted a formal resolution calling for bids for the unsold portion of this year's raisin crop. The proposals will be received at 2 o'clock of January 3rd. The block includes about 12,000 tons.

The Fullerton News makes the statement that C. H. Boughton, of West Glendale, picked from his twelve-acre strawberry ranch, from the 5th of April, 1905, $20,600 worth of strawberries. It is said that this is the heaviest yield of berries ever known for any number of acres. Mr. Boughton's clear profit was 55 per cent.

Prune growers from Sonoma County complain bitterly that carload after carload of Sonoma County's fine prunes are shipped to San Jose to serve as "facers" for "Santa Claras." That will always be the case so long as "outside" prunes can be bought at a quarter of a cent a pound cheaper than those grown within the sacred limits of Santa Clara County.

The board of supervisors of Stanislaus County has passed the following resolutions: "It is hereby declared unlawful for any person, firm or corporation, to bring into the county of Stanislaus any unrooted grape vine cuttings, unless the same has been fumigated with bisulphide of carbon immediately before bringing it into the county or the same is immediately fumigated after arriving and before being taken to the place where the same is to be planted."

AGRICULTURE.

The San Jacinto Record says 1000 acres are being plowed and seeded each day in that county.

Thermal onion growers are in the midst of replanting and the crop promises to be a great success.

America produced this year 52,800,000 pounds of hops and the Pacific Coast was well up in the representation.

The Salinas Index notes the closing down, for the season, of the Monterey Canning factory. A profitable year for the cannery.

The Fullerton News states that cabbage growers report that unless there is a good rain within the next few days the crop will have to be irrigated.

Owing to the increase of price for beets a number of farmers of Pajaro valley contemplate devoting considerable acreage to that crop the coming season.

The farmers of the new town of Corcoran in Kings County, are arranging to plant several thousand acres in beets on their lands adjacent to the town.

Theo. Kearney has offered the state 320 acres of land six miles from Fresno, and Prof. Wickson is quoted as saying it is the best proposition yet made the state.

Thirty-one sacks of cantaloupe seeds, amounting to over one and one-half tons, were in Colton one day last week en route from Rocky Ford, Colorado, to Brawley.—Colton News.

The Hanford Sentinel states that one firm of grain dealers at Hanford has just consummated a deal whereby they have sold 70 carloads of their wheat. There are about fifteen tons of grain per car, making a total of 1000 tons, which is probably the largest shipment of wheat ever made from this county by one firm.

Finlay McMillan, who for several years has been engaged in cereal experiments on his farm near Fair Oaks to secure improved seed, has quite a lot of new wheat four inches above ground, showing a beautiful growth. Mr. McMillan has been successful in his experiments, his neighbors gladly taking all the product of his culture that he can spare at good prices.

L. C. Hiserodt of Fullerton states that this season will not be as good as last for sweet potato growers because the output is very much larger. Growers are coming into competition with producers in other parts of the state and the demand for this product is not as active as it was a year ago. He also estimates that there are on hand now more potatoes to market than the whole crop of last season, and a good many farmers are complaining of the heavy decay in the present crop.

A large acreage of the dry and sandy lands that lie south and east of Ontario was planted this season to Egyptian corn says the San Bernardino Sun. This year's crop has proved very satisfactory to the grower. An estimate of this season's yield has been made by reliable parties in this territory of 30,000 sacks, or 60 cars of 500 sacks each. The market price for this grain brings $1.25 to $1.50 per hundred. These dry lands seem especially adapted for this cereal, and no doubt the acreage will be largely increased next year.

LIVE STOCK.

At a public sale held near Compton last week, cows sold as high as $125.

R. Pozzi of Marysville, has sold his creamery to G. H. Hellman of San Francisco for $22,000.

Remember the great Los Angeles poultry show to take place January 8-13, 1906. Big time, big entries, big show.

The express shipments for the week were 41 cases of eggs, 510 pounds of cream, 440 pounds of butter, and 1389 pounds of chickens. — Escondido Times.

Mr. E. H. Hoyt of Watsonville won a prize in the Jubilee Poultry Journal contest for an essay giving the results of his experience in running ducks for eggs, for which he chose the Indian Runner breed.

The poultrymen of Penngrove and other localities in Sonoma County are complaining loudly about their eggs being stolen from the cases after shipments are made, claiming that their eggs have been arriving in San Francisco short.

The express shipments for last week at Escondido were forty-five cases eggs, 1740 pounds of poultry, 450 pounds cream, and 339 pounds butter. It will be observed says the Times, that the production of eggs has increased within the last month from about 30 to 45 cases weekly.

The Mission View Poultry Ranch is getting a large number of birds in condition for the Poultry Show which will be held in Los Angeles during the second week in January. This famous ranch will offer fifty White Wyandottes beside about twenty-five other breeds of birds and turkeys.—San Fernando Valley Press.

In 1883, Mr. McNear of Petaluma imported the Clydesdale horse Pointsman, at a cost of $5000. This horse sired a number of horses whose get can be found, particularly in some sections of Sonoma, Solano and San Benito Counties, so says James McNab in his address before the California Live Stock Breeder's convention.

Complaining of the manner which some farmers care for their stock, often resulting in mange, the San Francisco Chronicle says:

"Mange is a filth disease never, we think seen on animals which receive decent care unless they have been exposed to outside contagion. It is the work of a mite which cannot establish itself if animals and their quarters are kept clean, but which, once established, is very difficult to get rid of."

MISCELLANEOUS.

The next meeting of the State Bankers' Association will be held at Santa Barbara during May.

Pasadena is making great plans for New Year's tournament of roses. But what about the roses?

San Bernardino County has bought the Arrowhead toll-road for $20,000, and hereafter it will be free for all to travel on.

On December 19th an oratorical contest for the championship of Southern California high schools will be held in Pasadena.

Walter Scott, the Death Valley mining millionaire—and fool, is supposed to have been murdered last week, coming from his mine.

The Kern County grand jury has recommended that the license be withdrawn from the slot machines in that county, and that that form of gambling be abolished.

The mouth of the Pajaro River is closed again and the filthy backwater from this slough is covering all of the west end of the valley.—Pajaronian.

Forty-two thousand barrels is reported to be the average daily shipment of oil from Bakersfield during the last two months, practically all being railroad fuel.

It is estimated that there are not less than 200 men about the railroad camps in the vicinity of Yuma starving to death while waiting in the vain hope of securing work.

Spraying a Small Orchard

Requires a small spray pump—but a good one. You want just as good fruit as the owners of large orchards who use power sprayers—and you can have it. Any spray pump has done its part when it provides a high, even pressure, keeps the spraying material well stirred, gives no trouble, and works reasonably easy.

Bean's Little Giant Pump

does all this and more. When we say it "keeps the material well stirred" we mean it too, and it's important if you want good fruit. And the "no trouble" feature lets you feel good natured after the days spraying is over. The valves can't clog, the stuffing box can't leak (because there isn't any) and the pump is so simple it is a pleasure to use it. Of course we have good pumps cheaper but **Bean's Little Giant** is altogether the best barrel pump ever offered for spraying small acreage. Also a splendid whitewasher

Write for our special offer, freight prepaid, and we will also send our illustrated Catalogue No. 16 describing ten sizes of hand pumps and telling what sprays to use and how to prepare them. State number of acres and kind of fruit. Write today.

Catalogue No. 18 describes "Power Sprayers."

Bean Spray Pump Company,
161 W. Santa Clara St. San Jose, Cal.

C. H. SESSIONS, ASSOCIATE EDITOR

VALUE OF STOCK TESTS.

Every farmer should possess a knowledge of the qualifications of his stock. Public tests of celebrated dairy cows may be of but little value to the average farmer, as he does not practice the modes of feeding during such tests, nor give the same care and management to his stock. But the tests are valuable, as indicating what an animal can be forced to do if the conditions essential to success are complied with. The farmer's business, says the Philadelphia Record, is to discover what are the conditions essential to success. He must have the example of others as guides, which will materially assist him, but there are conditions, however, peculiar to his own circumstances to which he must conform, and in which no one can assist him. His soil, climate, buildings, water, shade, quality of pasture, method of feeding and kind of food used are all important factors to be considered. So far as the denial of the utility of public tests is concerned, the fact remains that they serve as beacon lights, in the direction of which all must steer. It signifies nothing that the products of the cow may apparently exceed the nutritive value of food consumed, for the figures are stern, pointing unerringly to the realization of the objects sought, and, though the high-pressure public tests may be of the kind not approved of by the farmer, yet they open up to him a wide field for reflection, and teach him that, while he may not hope to equal such, yet he must also test his stock, if he is to succeed, without regard to capacity. Every animal on the farm should be tested, whether cattle, sheep, swine or horses. The ordinary cow should have her merits known to the dairyman, and he should familiarize himself with her qualifications, not only as a milker, but as to the kind and quality of food best adapted for her purpose, and the most profitable. A cow may give only 20 pounds of milk a day and yet be an excellent animal, if she can produce that amount at a low cost, while another cow in the same herd may yield 20 pounds of milk a day and yet be as profitable compared with the other. The ewe should give twin lambs, but it is more important that she give then sufficient nourishment, as well as yielding for herself a fair average of wool. The mare may be serviceable for all kinds of work, and yet be unprofitable as a breeder, while the sow, though bringing forth large litters of pigs, may be unsuccessful with them as a nurse. Nor are the males to be exeepted. The quality of the get is important, while they must also give a profit for themselves as individuals.

In order to know each animal it must, therefore, be tested, and tested not only at certain seasons, but at periods ranging over the year, in order to thoroughly understand all the conditions. Then the feed itself may be tested, as it differs in quality at different times. A crop of hay of one year may be different substance from that of another kind, and hence the results obtained during certain periods will not always enlighten the farmer as to his proper course another time, but such tests will materially assist him to avoid mistakes previously committed, and also teach him where to economize and when to be liberal and generons to his stock.

Public tests demonstrate that there is no limit to the capacity of an animal as long as the conditions are not complied with. It may be able to do more without having been given an opportunity for so doing, and thus it is on the farm. The farmer should not condemn his animals until he has faithfully endeavored to give them the full privilege of demonstrating their capacity, and when he has performed his part he will then know that his profits will be according to the quality of the stock, as he can retain any such as have proved themselves worthy of his confidence, while the inferior class will be discarded, the result being that the stock will be gradually improved and the profits increased.

TESTING DAIRY COWS.

During the past dozen years or more a member of the State experiment stations, including our own, have been called upon to conduct so-called official tests of dairy cows in which the production of milk and butter fat by a cow for a certain period is accurately determined by a representative of a station who is always present when the cow is milked, weighs the milk and determines its contents of butter fat. He makes out a report of the test and, with the owner, milker and feeder of the cow, makes an affidavit that her production of milk and butter fat is certified to, is true and correct to the best of his knowledge and belief. These tests have generally been conducted for seven days, and in some cases for thirty days. The total production of the cow during this period is therefore determined with absolute accuracy.

These tests have for the most part been conducted for Holstein-Friesian breeders, since these breeders have been greatly encouraged in conducting such tests by liberal prizes offered by their breed association. The feeling has become quite strong, however, among breeders of dairy cattle, both Holstein-Friesian men and others, that records made on such relatively short tests do not give a very reliable measure of the dairy capacity of a cow; that is, a cow may give a very high yield of milk and butter fat for the period when such a test is conducted, but may not continue to produce large amounts of milk and butter fat for any length of time, so that the total production of the cow for the year or the lactation period, either as regards milk or butter fat, may tell quite a different story than the result of a brief official test, conducted under especially favorable conditions, generally shortly after freshening.

The system of determining the dairy production of Guernsey of Jersey cows is based on monthly tests throughout the year, or the period during which the cow gives milk, conducted by a representative of an experiment station for one or two full days each month, in the case of Guernsey and Jersey cows respectively. The owner of the cows reports the actual quantities of milk produced by the cow during the year, and these figures are checked up by the station representative on his monthly visits to the farm. The average percentages of fat in the milk of the cow on the day of testing are furthermore used as a basis for calculating the production of butter fat by the cow for the calendar month during which test takes place. The sum of these monthly credits for milk and butter fat during the year or part thereof by the lactation period, is taken to represent the annual production of the cow during the testing period, and as a matter of fact comes within one or two per cent. of the actual production of the cows as determined by accurate weighings and tests of composite samples for periods of seven days each.

It has seemed to the writer that of the different systems proposed for determining the value of a cow for dairy production, the so-called "authenticated fat estimates" of the American Jersey Cattle club are on the whole the most satisfactory both to the breeder and the general public. During the last year a number of Wisconsin breeders of dairy cattle have expressed a desire that a similar system should be inaugurated by our station, and it has therefore been decided to arrange for tests of this character in the future. From correspondence which we have had with breeders in the State it appears that this move has met with general satisfaction, and the prospects are that within a few months quite a number of Wisconsin breeders will have cows entered for yearly records, according to this system. The rules for the conduct of these tests have been formulated and are subjoined, as they will be of in-

A Bunch of California Sheep on Native Pasture.

terest to breeders of dairy cattle among your readers. We cannot, of course, go outside the State in conducting these tests, but will be glad to have Wisconsin breeders take advantage of the plan proposed to determine the dairy production of their cows, and we believe that it will be greatly to their advantage to do so.—F. W. Woll, Wisconsin Experiment Station, Breeders' Gazette.

HANDLING THE DAIRY BULL.

The experience of the Kansas Agricultural College with bulls indicates that it is not safe for a man to take any risks, even though the bull may appear gentle. One of our careful and painstaking herdsmen was forced up to a stone wall by a bull that had pushed the gate open while the herdsman was endeavoring to catch him with the bull staff, and, although this herdsman had tried to be very careful, a little carelessness in seeing that the gate was not fastened until he had the bull caught came very near costing him his life. It is comparatively easy for a herdsman to get careless while handling a gentle bull, but while he may think him perfectly safe he is nevertheless dangerous; tame bulls do the damage. A good, strong ring in the nose has much to do in taming a bull. If it is not enough, a chain attached to this ring and dragging on the ground will result in his stepping on it from time to time and aids very materially in holding in check his vicious disposition. Usually this chain can be reached with the bull staff and so help in catching him.

The only safe plan to follow is for the herdsman never to go into the yard without some form of protection, as a pitchfork or a sharp pointed prod; and if the bull shows signs of being disagreeable it would be better to have two persons around when an effort is made to capture him. A bull should always be handled so as to let him know that the herdsman is master. The bull's disposition is greatly improved by currying and by offering him apple cores, turnips, and other delicacies which appeal to his taste. No one should ever be allowed to tease him.

DOGS VS. SHEEP.

As the dog flourishes the sheep industry wanes. The cry which comes from every state is practically the same. The losses from the dog infested localities stand as a barrier to sheep expansion. This dog menace is worse than any ever caused by wolves, worse than the gadfly or gid, or nodule disease, or lung, stomach or tape worms, or adverse tariffs—worse than all these combined.

Even in Ont, where there is blue-blue-grass ahead of Kentucky, and coarse grains for feeding sheep ahead of the average yield of the United States, the sheep industry is declining. The cause of the decline is the increase of the dog and the mischief he does. One of the worst features of the evil is the fact that it becomes more aggravated as the population increases. On the ranch losses from dogs are the exception. As towns grow and cities enlarge, the sheep industry recedes from them. The opposite should follow.

Should there be any great impropriety in farmers generally who own sheep shooting down every cur which comes upon their farms unaccompanied by his owner? In what other way can the farmers protect themselves when the law persistently refuses to protect them? It may be answered that in this way valuable dogs may be killed. This would be possible, but not likely. Valuable dogs, like good farmers, stay pretty close at home. It is the vagrant dog that wanders. So long as the farmer fails to assert himself the dog men will overrun him and the dogs will overrun the earth.—Prof. Thomas Shaw, Minn. Agri. Col.

VALUE OF SALT.

Animals will travel long distances and brave great dangers to get at saline earths, called salt licks; horses and cows are most healthy when provided with lumps of rock salt in their mangers or pastures, and even bees will sip a solution of salt with avidity. Men will barter gold for it in countries where it is scarce, and for it husbands will sell their wives and parents their children. In some districts of Africa salt is far more expensive than the purest white sugar in Europe, and children will suck a lump of it in preference to sweetmeats. But the existence of a greater or less appetite for salt in all individuals shows that this substance serves more important functions than that of merely gratifying the palate.

Salt being a large constituent of the human body and forming about half the total weight of the saline matters of the blood, the constant loss of it by the secretions, the bile, and even tears, requires to be made up by its employment as a condiment. The free acid found in the stomach, and which forms an essentail constitutent of the gastric juice, is obviously derived from the salt taken with our food; and the soda of our blood and in some of the secretions is doubtless obtained from the decomposition in the system of common salt, which is the only mineral food of man and the only saline condiment essential to health.

One evening, while enjoying a visit from an Englishman, hickory nuts were served, and this English friend called for salt, stating that he knew of a case of a woman who was taken violently ill by eating heartily of nuts in the evening. The celebrated Dr. Abernathy was sent for, but it was after he had become too fond of his cups, and he was not in a condition to go. He muttered "Salt! salt!" of which no notice was taken. Next morning he went to the place and she was a corpse. He said had they given her salt it would have relieved her, and if they would allow him to make an examination he would convince them. On opening the stomach the nuts were found in a mass. He sprinkled salt on this and it immediately dissolved.

JERSEY TEST.

Editor Cultivator—You published a photo and report of the year's work of one of my registered Jersey heifers, Evelyn of Venadera, in May of 1904. This was as a two-year-old with first calf. She gave in 365 days, 7,045 lbs. of milk, containing 341.81 lbs. of butter fat, equivalent to 402 lbs. butter 85 per cent. fat. I am now enclosing you the official yearly test of Evelyn of Venadera with second calf. She dropped her second calf August 20th, '04, and began an official yearly test at three years and four months of age, September 1st, '04, under the supervision of Mr. C. S. Burgess, official tester for the American Jersey Cattle club for Southern California. For the 365 days ending August 31st, 1905, she gave 8,714 lbs., 15 oz. of milk, containing 457.25 lbs. butter fat, equivalent to 537.94 lbs. butter 85 per cent. fat; an increase of 1,669 lbs. of milk and 135 lbs. of butter over her record as a two-year-old.

To be eligible to the A. J. C. C. register of merit, a cow three years old must produce 300 lbs. of fat in a year. It will be noted that Evelyn produced 157 lbs. above this mark, or 57 lbs. more than is necessary for a mature cow.

I take special pride in this excellent official record made by Evelyn as a three-year-old because of the fact that she was bred and raised in the Venadera herd. Her sire is Harry B. Gordon, No. 47246, a bull that stood at the head of the Venadera herd for several years. Her dam was Elaine C., a splendid cow of the Coomassie and Pansy families.

Evelyn is a handsome cow, light fawn in color, with a splendid udder and extra fine teats, well placed. She is due to calve again in the near future and should she continue to improve until she reaches maturity, as she now promises to do, she will certainly prove to be a very prenomenal cow.

I have a few other daughters of the bull, Harry B. Gordon, now on official test, and I will send in reports of their work when finished.

Yours very truly,
GUY H. MILLER.

Official Yearly Test.

FIRST-CLASS MILK.

Wallace's Farmer truly says, "first-class milk cannot be produced in an improperly built stable." And Nevada Dairyman adds: "Not one cow stable in a thousand, in the driest dairy districts, is properly ventilated. Is it any wonder that cows become diseased; that tuberculosis and a host of other diseases take hold of the cows in these close, foul stables? One would think the dairy farmers would take hold of this matter for the sake of their own property, the cows. But a talk with them will reveal that ninety-nine per cent take no stock in the idea that pure air is necessary to keep a cow healthy and make her more profitable."

The Cultivator knows, from observation and examination, that not one

in twenty of the California dairy stables are built as the laws of sanitation require. They are too small, cattle are crowded into them with no attention to hygiene principles whatever. While it is essential to have warm stables in California even, during the cold months, it is just as necessary that ample allowance shall be made for fresh air. Most every man knows that cows must be kept warm if they are going to give their best profit. Accordingly the farmer will shut the cows up at night in a close stable in order to keep in the heat and by morning it is enough to knock a man down when the stable door is opened. No better breeding place for tuberculosis could be found than such a stable, if there is one diseased animal.

WORLD EATING UP ITS SHEEP.

The sheep growers in California may be encouraged by the fact that the price of wool and mutton is tending upward. "Many cannot understand this," says the Dakota Farmer, "and not knowing the facts are disposed to predict a sudden and disastrous reaction. We confess that for a time this was our personal view of the matter, but the more we look into the situation the more we believe that good sheep will be extra good property for a long time to come, tariff or no tariff. There will be spots where the demand is not felt evenly, and prices may go off a little, but the country over, the demand will be strong.

Consul Williams of Cardiff, Wales, has made a report on the sheep situation covering a wide range of country. This report is almost startling, but being from an unquestioned authority is well worth studying. Mr. Williams says:

"The world is eating up its sheep. Its flocks have been declining for three decades, and that decline has become perceptible in so many countries that it is regarded as the most remarkable agricultural movement of our times. A number of independent causes have co-operated to bring about this result. The first to be noted in the modern method of studying Hebrew history and literature. This has brought to light the fact of the preponderance of mutton in the meat diet of the Hebrews from the earliest times, a preponderance that accounts in part for the character of their civilization, and their persistence as a race. The dread of tuberculosis and pleuro-pneumonia in some countries, and of trichina in others, has led to the substitution of mutton for other meats by several classes, especially those influenced by the lurid accounts in the sensational press. The high prices of beef in recent years has forced many others to make a like substitution. But the principal cause of the decline of sheep has been the movement of the agricultural population to the industrial centers in the towns and cities. This class, with an already acquired taste for mutton, is able to gratify that liking to a greater degree in the town than in the country, both on account of the better opportunity offered by the open market, and the increase of its purchasing capacity by the higher wages paid in the towns.

THE HAY CHOPPER.

In the northern part of California the cattle feeders as well as the dairymen are using with much success, a machine to chop their hay. It is called a hay chopper, and is specially applicable to the cutting of alfalfa.

An exchange gives these points of value in the machine. It costs about $700, and will chew up 150 tons of alfalfa per day at a cost of about fifteen cents a ton for the chopping. Some growers chop the hay direct from the windrow while others stack it in the regular way and cut as they need it through the feeding season. The former claim that they can put hay into a stack through the cutter just as cheaply as the long hay can be ricked. It is an easy matter to put 2 1-2 tons of chopped hay in the space required for one ton of long hay and it is so compact that it is almost impervious to water.

We have not seen the machine, but from the description it must be convenient to handle and it certainly ought to be a very great saving on hay. It is estimated that it costs fifteen cents a ton less to feed it than the long hay. One would naturally think that this fine chopped hay would all blow away or at least would waste badly when handling it in the wind, but strange to say, it does not waste like long hay because it lays so compactly. No difficulty has been experienced in keeping the hay cut direct from the field. It is very noticeable by those who have fed both ways that cattle feed much quieter on the cut hay. They soon learn that it is all alike and just as good at one place as another, and are not continually chasing about and fighting each other away, dragging a bunch of hay along and dropping it as they run. It is claimed by those who have tried it that with cut hay as many horned cattle can be fed in a given space as of dehorned ones on long hay.

NEW DAIRY BUILDING AT AMES.

The new dairy building at Ames, Iowa, will soon be finished and when fully completed it will have cost $60,000. The building is being equipped with all kinds of dairy machinery and dairy utensils. A dairy laboratory is also being furnished and the entire inside furnishings will have cost $10,000 when completed. The building will be one of the best of its kind in the United States. In addition to this improvement at the Iowa State College, a farm has been purchased for which 100 cows will be obtained as soon as posible. It is evident that the State is beginning to realize the importance of the dairy industry to Iowa.

SHELTER THE COWS.

The last few nights have emphasized the importance of having warm barns for dairy cows. Although we are in California we are not immune to cold nights now and then, and our animals feel the cold keenly, as is shown in the lessening of the milk flow. When these nights of wind come let the cows be well protected else the feed will have to be increased and even then the milk flow will be diminished.

WHERE CALFALFA IS MADE.

Popularity of the green food known as alfalfa meal sometimes, although more generally as "Calfalfa" has become more widespread as more people have tried this food with stock and with poultry. It's advantage was recognized almost as soon as the first of the product was put on the market, and has been, and is today used by poultry men, but the use by the stock men is much more recent, but is now becoming more and more general. While its price, compared with the price of the ordinary alfalfa, seems high, yet when it is considered that in feeding alfalfa hay much of the coarse straw is thrown out and wasted, while with calfalfa not a particle need be wasted under any circumstances. It is finely pulverized, consequently every little grain of it is digestible.

Mr. Madsen, the manager of the California Stock Food Co. at Fresno, recently showed the writer the courtesy of a look through the works where the meal is produced, and it was indeed interesting to see the various processes through which the hay passed, coming from the wagon as loose hay and going into the car at the opposite side of the works sacked as "Calfalfa."

The hay delivered from the wagons as they stand within the large warehouse is picked up by large hay forks, which carry the hay up near the table of the first cutter. As it leaves this machine it is found to be cut in lengths of two or three inches, and of course more or less broken up. From this machine it is taken in a large pneumatic tube and carried to a second machine, where it is pulverized into the fine dust-like product which is seen in the sacks as ordinarily in the market. From this it is carried in another pneumatic tube to the bins, from which it is automatically weighed and sacked, each sack containing exactly the same amount of meal. From the weighing table sacks are piled back in the storeroom, later to be trucked into the car and sent to all parts of the State.

When the hay is perfectly dry and in good condition for pulverizing, 100 horsepower is sufficient to carry on the work of pulverizing, but if the least bit damp so that the machines clog it has to be placed in kilns and dried before grinding.

Alfalfa hay is not a complete ration. The best results are got by feeding it with corn fodder, ensilage, wheat, or straw or roots. Alfalfa contains large amounts of protein.

Six to ten bushels of seed is the usual yield per acre.

Keep the weeds mowed or raked off the first season or they will choke out the crop.—Ex.

The gratifying news of the securing of the necessary 50,000 acres to warrant undertaking the organization of a Water Users' Association, says the Orland Register, has been received.

MRS. A. BASLEY, ASSOCIATE EDITOR, HOLLYWOOD, CAL.

A Happy New Year to all our readers! and may the new year bring prosperity in the chicken yards. The poultry industry is growing in this country every year, but there is still room for double as much as we now raise, especially in California.

No business will "run itself." To be "up to date" in any business requires industry, intelligence, perseverance and experience. May all of these be yours, and success in the coming year will surely crown your efforts.

THE COMING POULTRY SHOW.

In talking about our "Brooder Chicks" I had almost forgotten a promise that I made to some of our readers to talk about washing or preparing fowls for the show. I did not realize how near the time of the Los Angeles Exhibition has come. It is to be from the 8th to the 13th of January, so there is no time to be lost in preparing for it. About two months ago I advised every one who intended to exhibit to look carefully over their fowls and pull out all imperfect, stained or broken feathers. It takes a feather about two months to grow out to maturity. I also described how by gently manipulating any refractory feathers, such as a too high tail or feathers not folded properly in the wing, can be corrected. Combs can also be straightened by gently raising them to their proper position every day for some length of time.

Having two months ago decided just about which of your fowls were to compete for honors at the show, I advised you to have your scratching pens cleaned out two weeks before the time, filling them twelve inches deep with clean wheat hay or straw and keeping them full, the straw being so deep the hens soon get perfectly clean and glossy, for each time a hen scratches she covers herself and often her neighbor with the straw, and that slipping down her back or over her wings gives her a gloss equal to polishing with a silk handkerchief. I know it because I have tried it over and over again. I have washed white Plymouth Rocks for every show, and I think I may claim to be an expert at washing. I have also tried cleaning them, the same way I clean knitted or crocheted woolen shawls, with pure flour or white corn meal, but in my estimation nothing comes up to making the hens do the work themselves by keeping them in deep, clean straw.

Now I will tell you about the washing of white fowls exactly the way I did it. I had read in the Eastern journals that an expert man could only wash four white fowls in one day. I had also read that the room in which they should be washed must be kept at a temperature of 110 degrees F., and that it was absolutely necessary to wash the fowls if one was to even hope to win a prize.

The reason given for keeping the room so warm was that if colder the feathers when dry would not be fluffy but would look rough or stick together. This I found to be true, and at first I had great difficulty in getting the room up to the desired heat and keeping up the heat, until I resorted to the plan of heating up my smallest brooder house by putting in two coal oil stoves and then had no more difficulty as to the heat. The directions for washing orders three tubs to be ready, the first containing good warm suds, the second lukewarm water and the third cold water with a little blueing in it, not quite as much as for blueing white clothes.

I found by experience that it was easier to use the clothes boiler for the first tub as it was a better shape and deeper. I first cup up a bar of Ivory soap, dipped enough of this into the boiler to make a good suds. Had these suds just as warm as I could bear my arm in. The articles I found necessary were a sponge, a good sized bit of flannel for a wash rag, a nail brush and another bar of Ivory soap and a half dozen clean linen towels, three wash tubs and the boiler. In the boiler were the hot suds, first tub warm water, second tub cooler, third tub cold blueing water. The reason for using an extra tub was because the first time I washed fowls I did not rinse out all the soap and when I dipped them into the last water all the blueing stuck to the feathers and I had such blue fowls I had to leave all but one at home, and he was the laughing stock of the show. After that time I took good care to use an extra tub and rinse out all the soap.

The day on which I commence to wash the birds I catch the four I want, put them into a coop ready, then having prepared everything and finding the temperature right, the thermometer standing at 110 degrees, I take the first bird, usually a cockerel, holding him with his legs between the fingers of my left hand, his breast on the palm of that hand and my right hand on his back, I gently lower him into the suds in the boiler. A look of surprise comes into his eyes, but he does not struggle, sometimes even pecks at the bubbles. I gently sponge down his back and wings. When he is thoroughly soaked I begin to scrub with the soapy flannel and use sometimes the nailbrush on very dirty spots. I wash first one wing thoroughly, spreading the feathers and seeing that each feather is clean from the skin out, then the other wing, then the back and tail, then the breast and fluff, and lastly the head and neck, being careful not to let the suds get into the eyes. By this time the bird is nearly asleep, the warm water and rubbing making him drowsy, when he seems perfectly clean I take him out, gently squeezing the suds out of him, and put him into the first tub. Here I take the sponge, rub and sponge him very thoroughly for a few minutes and then put him into the second tub, rinsing his wings up and down. When I think he is perfectly clear of soap I pull out a feather and putting it in my mouth taste it to see if there is a suspicion or slightest flavor of

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the GOLD MEDAL at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.

And Now Comes New Reward for Merit:

Read the following telegram received from the Lewis & Clark Exposition at Portland:

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

soap, and if it is perfectly clean I then plunge him into the cold blueing water, holding him this time by the wings and dipping head and all well under. Taking him out again I squeeze the water out, passing my hands downwards the same way the feathers go. I then take a towel and wipe him down. Then seizing him by the legs half throw him up to make him flap his wings. This shakes a great deal of the water off. I then take towel after towel and wipe him as dry as possible. I then give him a pill of half a teaspoonful of cayenne pepper mixed in a little butter to warm him up, and put him into a clean coop with white sand in the bottom. He soon begins to shake and plume himself, and in a few hours is dry. I give him wheat to eat and before night also water to drink. Whilst he is drying I proceed to wash the pullets exactly the same way. You can easily understand why only four can be washed in one day. They all must be washed before noon in order that they may be perfectly dry before sun down, otherwise they will be almost certain to take cold and their feathers will look rough, and the judge will cut them as "out of condition."

In the afternoon of the same day I clean the legs and feet. These have been well soaked and washed during the morning operation, or if I have not washed the birds I still clean the feet and legs by giving them a good scrubbing, using an old tooth brush or nail brush and clean, hot suds. I then hold the fowl on my lap and clean each scale on the feet and legs with a toothpick or sharpened match or my own nail cleaner, just as I would clean my own finger nails. It takes about an hour, sometimes more to clean under each scale. I then wash off again and rub the legs with a small bit of butter, wiping it all well off so that the dust will not stick to it.

I rarely trained my fowls in exhibition coops to be handled or pushed around with a stick, as many advise; because all my fowls were accustomed to being kindly and frequently handled, and the White Plymouth Rocks, my special breed, are of such a gentle, happy disposition (hens have characters and dispositions as well as human beings) that they did not require special exhibition manners to be inculcated as the Mediterreancans do. "Grandma likes her fowls to be friendly, so you must not scare them!" I heard my little grandson remark to a stranger. My fowls are all friendly, and so are not afraid in the show room, but it is a good plan to keep fowls for a week or two in exhibition coops, and to push or move them with a small rod or stick many times a day, each time regaling them with some little delicacy, such as a bit of green lettuce or some meat, so that whenever they get a push they expect something good in return and walk bravely up in front to receive it, instead of cowering in the corner. I have also trained fowls to stand upon a small table and be stroked down. Fowls at first do not like to be touched on the top or back of the head, but they like to be stroked or quietly rubbed under the chin; so it is best to begin there and gradually accustom them to being handled many times during the day.

I have frequently tamed the wild and beautiful Red bird in two days by putting the cage on a chair in the kitchen where the whole family was passing and talking, familiarity and kindness quickly tames any bird or fowl. The use of trap nests will keep the most nervous of hens perfectly tame. They get used to being handled, and, finding that it does not hurt them, will soon become gentle and tame.

I did not like the idea of using flour to clean the hens, as, if it got in the least damp or wet it pasted the feathers together. One man advocated chalk for cleaning white fowls, and another said he tried paroxide of hydrogen. I never used anything but Ivory soap. I saw some fowls on which borax had been used; they looked yellow, and I would not advise the use of borax or soda, or any of the soap powders.

* * *

EDITOR'S QUESTION BOX.

Scaley Legs, etc.—(A. L. Campbell.) Will you please tell me through the Cultivator how I can get the scales off of scaley-leg hens. Many of my pullets are just getting the disease; I suppose from three hens that had it when I bought them. These hens' feet I soaked in warm soapsuds, but the patience of the hens as well as my own gave out and no good result followed. I am now greasing them with vaseline and sulphur, but this seems hopeless as well as endless.

(2) Nearly all my February and March pullets are moulting. Is this usual or are mine an exception to the rule. I have not changed their feed and they have every comfort I can give them.

(3) My best pullet lays such thin-shelled eggs that I cannot set them. She has free range, Maryland grit and plenty of shells. Can it be remided, and if so, how?—A. L.

Answer.—The scales come from a small insect which lives and breeds under the scales of the feet and legs. It keeps on burrowing in deeper and deeper until it has been known to even destroy the bone. The usual recipe for killing in scabies is equal parts of coal oil, lard and sulphur well rubbed in every two days. Some people merely dip the feet and legs into coal oil. This I consider too severe, as it burns and lames some fowls. A certain and sure cure in usually one application is to rub well in and press as much as possible under the scales common mercurial ointment. This usually cures at the first application, so it would not try your patience. Keep your perches painted, once a week, with Lee's Lice Killer. This will kill any wandering scabies and stop the infection.

(2) You fail to mention what breed it is that is moulting. Mediterraneans hatched before April frequently moult the next fall. The American breeds usually do not, but much depends upon the food and care.

(3) Thin-shelled eggs are due sometimes to a lack of lime in the food, sometimes to the hens being overfat, occasionally to enfeebled constitution or to inflammation of the shell-forming chamber of the oviduct. Over stimulation of the egg organs by the use of pepper or the so-called egg foods will have this effect. Worms in the intestines may also produce irritation that will affect the oviduct. The treatment is to remedy the cause. If from lack of lime supply more oyster (not clam) shell; if from over-fat, feed more alfalfa and animal food and less grain. One or two doses of sulphate of magnesia (one heaping teaspoonful to a pint of water) kept before the hens for a day twice a week will help to remove the fat. Feed a properly balanced ration and do not try to increase the egg yield by using stimulants that irritate the organs of reproduction.

The first annual exhibition of the Hawiian Poultry Association was held at Honolulu Dec. 7, 8, and 9, and was a most unexpected success. The general interest and the large number of birds shown proved a pleasant surprise to our insular fanciers, and they are to be congratulated upon having awakened such an unusual interest in the poultry industry.

The Los Angeles County Poultry Association has abandoned its show for 1906, and united its forces with those of the Poultry Breeders' Association in a joint "round up" poultry show to be pulled off January 8-13, 1906.

Get after the lice and mites. They multiply fast, cut down the egg yield, and make life a burden to the hens.

THE FRESNO POULTRY SHOW.

After attending the San Francisco and Alameda poultry shows it was the pleasure of the writer to drop in on the opening day of the Fresno Show, not nearly so large as the others, but at the same time many of the classes were well filled, and as a rule a remarkably good showing of birds was made. On this point Judge R. J. Venn said: "I can truthfully say, after being one of the judges at six of the Fresno poultry shows held in the past, that we have never had one before in the city that was near so good." In fact it was remarked that it was the best ever held in the city, and the attendance was far in excess of that of any of the past shows. This continued from the very opening day till 10 o'clock of the evening of the closing day. There were 600 paid admissions the first day.

There were three hundred entries. The Barred Rocks easily lead in numbers, next being S. C. White Leghorns, with Buff Leghorns and Buff Orpingtons following. The coops were all arranged in rows of one tier high, and the light was of the finest. Each bird was equally displayed to the satisfaction of all exhibitors as well as the public. The turkeys on exhibition attracted much attention, for it is very rare that birds so near the standard of perfection in this class get into the show room.

There was a large display of various makes of incubators and chick foods; also all kinds of chicken appliances, which was interesting to poultrymen as well as the sight-seeing public.

The judging was done by R. J. Venn, the other judge, Mr. B. M. Woodhull, was prevented from attending on account of sickness in his family. The ribbons were all up on the morning of the opening of the show, and special prizes and money were all delivered to winning exhibitors before the close of the show. Due credit for the fine show and its good management must be given to H. H. Holland, president, and Geo. R. Andrews, secretary, for they have worked hard both early and late to make the show a success.

SOME PRICE WINNERS.

Some remarkably fine Buff Leghorns exhibited at San Francisco and Fresno shows called for much attention by their beauty, and so far as the expression applies to poultry, perfection according to the standard. This stock was some of the same birds, and all the same strain as that exhibited at St. Louis, and later on made the winnings at Portland. The birds belonged to the Lindgren Bros. ranch of Kingsburg, this State. Mr. Lindgren informed the writer recently at Kingsburg that his winnings had been really surprising to himself, though he knew he had given much personal attention and care in breeding this fine line of birds. The results at St. Louis were most gratifying. At Portland he won first, second and fourth on cockrel, first and second on hen, first on pen, second and third on pullet. At San Francisco he won first pen, first and third pullet. At Fresno first and second cock, first second and fourth hen, first, second and third pen on the premiums for pullets.

These prize winners will now head his pen for the coming year's business. We may also add that at Fresno these birds won the ribbon from the American Buff Leghorn Association for best cock, cockrel and hen.

THE PEAR THRIPS.

(Continued from First Page)

During the second larval stage of the young thrips a very decided change takes place. The second larva, like the first, feeds voraciously and after some three weeks the egg reaches a size often larger than that of a fully matured insect.

At this time it ceases feeding and fall to the ground. We have observed but few deliberately walking down the tree. Each individual goes into the tree separately, entering by some crack or worm hole, and having reached a secure depth it hollows out for itself a little cell,, and in this chamber it remains quiescent until the following year. Thrips get down into the ground from three to ten inches, according to the structure and condition of the soil; the prevailing depth is from four to five inches. They are scattered generally from a few inches to several feet from the trunk of the tree.

The pupal changes takes place in the ground in the same cell where the larva has spent so much of its time. We have not determined how long this stage lasts.

Orchardists know the adult insect best. It is the adult which comes to our trees in countless numbers and which does the greatest injury to fruit buds and blossoms. The mature insect, having wings, flies up from the ground to the tree and, if it finds the tree in suitable condition, at once begins to feed; but if it does not find the proper conditions, it moves on to other and better places. Thrips remain close during the day, either feeding or depositing eggs. They often leave the food plant just before sundown, and it is especially at this time that they migrate from place to place.

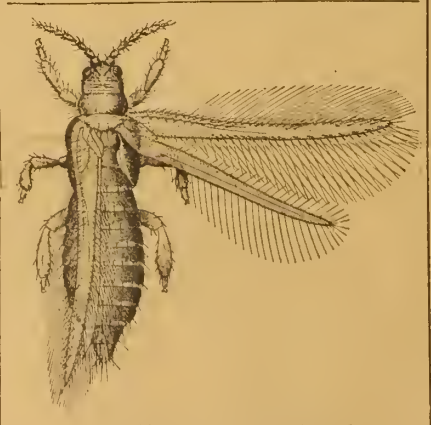
FIG. 7. Pear branch, showing the rolling and the cup-shaped deformities of the leaf; injury caused by the feeding of young thrips.

Spraying.—It has been stated with regard to killing thrips by means of various mixtures that whatever these mixtures are they must be thoroughly applied to do even fair service. We have learned from this year's experience that for this particular thrip spraying is a very unsatisfactory means of control. The insect is hard to reach because of its manner of hiding in bud or blossom, and difficult to kill without injuring the tree with the spray mixture itself. Because of its habits of leaving the ground, extending over a period of several weeks, and its habits of migrating, one might apply sprays and kill most of the insects on his trees and within a very few days find an infestation as heavy as before. The injury, as we have seen, is so rapid and fatal, taking but a few days (four or five) to ruin an entire orchard, that were we to depend on sprays all work would necessarily have to be done in a comparatively short time and repeated often, and this of course is impracticable.

It does not seem necessary at this time to give in detail the results of the spraying experiments which we carried on during the past season. Fourteen different formulas were tried, including various forms of soap washes and caustics, tobacco, sulphur, crude carbolic and creosote oils. The sprays were carefully prepared under the personal supervision of Mr. Budlong and myself, and applied with a Bean power outfit with the Bean Cyclone and Vermorel nozzles, under pressure of from 140 to 170 pounds. The results were very unsatisfactory. Exposed thrips would be killed, but those within the blossoms or buds showed almost no signs of injury. New adults and also young thrips,—for the young continued emerging from the stems and leaves where the eggs had been deposited,—appeared on the sprayed trees within a day or two after the washes had been applied; and after four or five days the trees revealed almost as heavy an infestation of both young and mature thrips as there was before any spraying had been done. No one wash proved satisfactory, and apparently under the conditions none can.. Sprays will doubtless be tried again, but they can only lessen the number of thrips with little or no appreciable results, and some injury to the tree is almost certain to follow.

Modes of Cultivation.—From the foregoing it might seem an almost hopeless task to check the thrips by either natural or artificial means. The insect, as we have seen, spends the greater part of its life beneath the soil, and this is probably the best time to attack it. After the larva is fully grown, it leaves the food plant and seeks a secluded place in the ground. On entering the ground it follows openings such as cracks, or holes made by insects or other worms, and reaching a depth of from four to six inches, though often deeper, it hollows out a small cell on the side of the larger opening, and thus securing itself, awaits further developements.

We believe that if the ground be thoroughly ploughed and cultivated during November, December and January, or before the insects leave the ground, which they begin to do by the first of February, many of these young thrips would be killed, or so disturbed that but few would ever reach maturity.



Pear Thrips, greatly enlarged.

Our present manner of cultivation is well adapted to give the thrips a long, undisturbed period of rest. During the late spring and early summer, when thrips are in the ground, we give the soil nothing but light cultivation, and as the insects are still in an active larval stage they seek another place of hiding, if disturbed. After this no cultivation is usually done until the last of February or March of the following year, by which time the insects have left the ground. While the plowing and cultivating method of control has not been thoroughly tried, we believe it gives more promise than any other yet suggested.

Summary.—The insect is single brooded. Adult females appear and begin to deposit eggs in February. After four days in the egg the young appear, feed for a time on the tree, then drop and enter the ground, where the greater part of the year is passed.

No effective natural enemies are yet known.

Owing to the insect's method of feeding, its habits of coming from the ground, extending over a period of several weeks, and its habits of migrating, sprays can be only partially effective, even where thoroughly applied .

We suggest winter plowing and cultivating, with careful working about the trees, so as to kill or injure the immature forms of thrips. This plowing must be done before the first of February, at which time the mature insects begin to come out from the ground.

JAPANESE HONEYSUCKLE

This Floral Wonder is the Latest Importation from the Land of the Mikado

Is a sturdy rapid climber and within sixty days after the time it is planted will drape your piazza with a brilliant mantle of green luxuriantlyspotted with beautiful white flowers turning to yellow. It blooms constantly—is never bothered with insect pests and in the Western parts of the states of Oregon, Washington and California holds its foliage throughout the entire winter season.

The plant is a genuine floral wonder. Its thriftiness, hardiness and prodigal bloom speaks volumes for the skill and plant-loving proclivities of the little brown people of the Occident who 've nurtured and improved this climber for so many years. We have imported a large number of these parent vines from Japan. They take root on this coast as readily as as they do in the native clime. If you are fond of beautiful climbers and appreciate something in plants decidedly bizarre and out of the ordinary, try some Japanese Honeysuckle on your porches and fences. You'll be charmed to see how beautiful this plant will make an ugly old fence or shed apppear.

IVY COLLECTION—No garden is complete without Ivy. We have a fine stock of healthy roots. The old favorites Boston Ivy—English Ivy—Kenilworth Ivy—and Variegated Ivy are 25c. per poot or the set of four for 50c.

CLIMBER COLLECTION—We will send you this whole collection of seven climber roots postpaid for $1.00 Japanese Honeysuckle—Kenilworth Ivy—English Ivy—Trumpet Creeper—Japanese Hop—Virginia Creeper—Boston Ivy.

Our shipments are all packed with extreme care. All roots are imbedded in moss and will travel ten miles or ten thousand miles with absolute safety. They will arrive in perfect condition; are ready for immediate planting.

Queries and Suggestions

STINGLESS BEES.

An "Anxious Subscriber" wishes to know where he may obtain stingless bees. This is a point about which all are anxious; who has them?

LOGAN BERRIES.

Editor Cultivator: Should Loganberry plants set out last spring be pruned this fall? If so how, and when.—H. Fallbrook.

You had better leave your berries until just after the next crop is off and then prune from eight to sixteen inches high. With dewberries the whole top is usually cut off after fruiting, close to the ground. Some have followed this course with Logans, but we do not know the result.

THE POTATO WORM.

Mr. Frederick Maskew of Long Beach, one of the best etomologists in the State, inform us that the so-called potato worm which a Santa Barbara correspondent writes about is doubtless not a worm at all, in the strict sense of the word, but the larvae of a caterpillar, coming from the potato tuber moth (Gelechia opunterella). This moth was first discovered in California in the early nineties, and has been spreading throughout the State slowly but surely ever since. It attacks only stored potatoes. The only remedy is to put the potatoes in tight bins and treat with bisulphide of carbon. The State University has issued a bulletin upon this pest, but we do not remember the number of same, but doubtless it can be had by writing to the Director at Berkeley.

POINSETTIAS.

Editor Cultivator: I have a poinsettia which I have had in a five gallon can since June, and is now budded. The body is about an inch in diameter and two and one half feet high. Do you think it should be put into the ground? Will it endure 28 degrees temperature? I found it would not endure the very hot sun during summer. The leaves wilted and some of the lower ones fell off.

Eleanor, Orland.

Your Poinsettia should not be planted out or disturbed until warm weather of spring, then put it in the ground. You are in error regarding the heat of summer; what your plant lacked was water. The poinsettia (Euphorbia pulcherrima) is a native of Mexico and wants the very hottest place you can find for it and is usually injured by frosts each winter, except in our most favored spots.

The plants should be cut back severely every year, late in the spring, just before the season's growth starts. The proper training begins with the young plant, which should be cut off one foot above the ground, the second year cut back the past season's growth to one foot and keep this sytem going for all time and you will have a finue, compact bush, which will produce a heavy crop of flowering heads. If left alone, they will grow up tall and spindling, and the flame-colored bracts which surround the flowers will be small in size and often pale in color.

The plant needs but little irrigation or cultivation except just before the flowering season. After they make their season's growth or about midsummer stop watering them and allow them to rest before making an effort to bloom.

ROSES FOR SUN OR SHADES.

Editor Cultivator: "Among my climbers, I have two that are not doing well, a Reine Marie Henriette and a Gloire de Dijon. The Henriette is on the north side of a porch facing east. It seldom blooms and when it does they mildew in the bud. The foliage is also affected. I do not over-water it. It does not get much sun. The Dijon is on the other side of the porch and gets sunshine most of the day. It does fairly well in winter, and the flowers are very large, but in summer it dies back, and does not flower at all. They are six years old. Had I better throw them away and plant other kinds, or can I do anything to help them?—Rose Fancier, Downey.

Great benefit would accrue simply from exchanging places with the two roses., The Henriette wants all the sunshine obtainable, though a house is a very poor structure on which to train roses if you wish good results, unless it be those varieties requiring whole or partial shade. Personally, we are not fond of Henriette, much preferring Climbing Souvenir de Wootton, James Sprunt of even the annual blooming Reine Olga de Wurtenburg, a glorious rose in its season. Our climate is too hot and dry for Dijon, if exposed to full sun. This rose should be given the sun only until 10 o'clock in the morning or late in the afternoon, when it has lost much of its power. Places can often be found where the rose could get a little sun at each end of the day, and none of the extreme heat. Such an exposure is best for Dijon.

"YOU MUST SHOW ME."

The above sentence is heard so frequently in business that we have come to believe that it is evident that it must have some deep meaning behind it. If a traveling man for some big farm implement house calls on a dealer in your town, the dealer says: "Yes, I'll try your drills, but you must 'show me' or give me back my money. If they sell well and stand the wear, I will want your line." This idea of "satsifaction or money back," is getting to be almost entirely the basis on which legitimate manufacturers do business. For some reason this "honor plan" of selling goods has never been applied to the scale of groceries and the various foodstuffs used on the farm. There is advertised in this issue the new idea as applied to the scale of a poultry food which is guaranteed to make hens lay and sold with the express provision that if it fails you get your money back. This food is called Security Poultry Food, and is put out by the Security Stock Food company of Minneapolis, whose goods are famous throughout the United States as being sold exclusively on the plan of giving every man his money's worth or his money back and letting him be the sole judge. Ask your local dealer to "show you" their guarantee.

Build up the country without tearing down our cities—build up the rural districts.

FOR SALE

One Holt 65 H. P. Agricultural traction engine, with extra wide wheel base, with water wagon, plow cart, and all necessary attachments.

One Holt Junior Combined Steam Harvester, fully equipped.

THE LAUGH OF A GIRL.

When the sky is burning red,
When the evening breeze is dead,
And the lake is burning blue and gold and pearl;
And I sit in silence here,
From the waters, low and clear,
There comes the rippling laughter of a girl.

O, the melody it brings,
Like a fairy voice that sings,
Breathing rest to all the troubles in the world;
As I lean to hear it die
It seems to tint the fading sky—
A mighty veil of sunshine westward whirled.

And I wonder as I dream
Of the girlish laughter gleam
That has brightened life since Eden closed its door,
What caused that sweet refrain—
Was it happiness, or pain—
That cried to me a dreamer on the shore.

—By Stanley Richardson.

New Year's on the Old Plantation

Christmas was never celebrated to any great extent in the South back in the good old days "befoh de wah." New Year's Day took its place among the masters, and the prolonged, rollicking "co'n shuckin'" supplied the slaves of Kentucky and Missouri especially with all the jollity they desired. It was an institution peculiar to the South, peculiar not in being confined to those sections, but peculiar in the manner in which it was conducted, for husking bees have been known in New England since the mind of man remembers and Indian corn has been gathered.

When a "co'n shuckin'" was decided upon notices were sent out to the slaves of all adjoining plantations stating that on a certain night Judge S. or Squire B. would give a corn shucking of so many thousand bushels and all colored people, male and female, were invited to attend. Great preparations were made by "ole massa" and "ole missus" for the event, for, while they expected a good night's work in the shape of wagon loads of yellow corn, pleasure was to be the main part of the programme.

Supper was always provided on a large scale and generally consisted of two or three roasted pigs, turkeys and chickens, with side dishes of vegetables in equal proportion. Bushels of sweet potatoes were baked, boiled and fried, and hundreds of rich, golden pumpkin pies were turned out of the oven done to a mouth watering brown.

A band of musicians was engaged, for no "co'n shuckin'" would be complete without it. On those nights negroes worked not happily save to the twanging of the banjo and wailing of the fiddle.

A corn shucking always lasted three nights continuously on one plantation, and then the negroes moved on to the next, where three more were devoted to the corn of the owner, and so on until all the maize of the neighborhood had been husked.

About twilight the darkies began to arrive from all over the country, the "boys" clad in their suits of jeans with that pride of the darky's heart, his "long tailed clawhammer blue." Every negro who made pretensions to being "anybody" possessed one in more or less condition to wear.

The female portion of the gathering was coquettishly dressed in linsey woolsey frocks, with their heads tied up in flaming red bandanna handkerchiefs, the redder the better, and with a white handkerchief crossed upon their breasts.

They came in groups, and each party of huskers from a neighboring plantation was announced long before it arrived by the well known tunes prevalent in those days floating down the road and over the fields as the happy boys and women hastened to the gathering. A favorite tune was this:

Yes, we's gwine to de shuckin',
Yes, we's gwine to de shuckin',
We's gwine to de shuckin' of de co'n,
An' we'll be dar in de mo'nin',
An' we'll be dar in de mo'nin',
We'll be dar in de mo'nin', shuah as yo's bo'n.

As soon as the darkies were all assembled the oldest slave present went to "ole massa" and begged a piece of silver money. This was always expected, and a plantation owner would as soon have thought of having a "shuckin'" without corn as to be unprepared to produce the bit of silver on the first evening.

Taking this piece of silver, the ancient darkey returned to the field and there performed a ceremony the exact meaning of which has not come down to us. Whetting his jackknife upon the silver, he solemnly pronounced an invocation for a bountiful crop of corn the following year. And it is doubtful if the "ole massa" would have been any more willing to allow the husking to proceed without this kindly prayer than would his white haired servitor, who by this means thus once a year stood in the attitude of high priest to the family he served.

After the preliminary prayer the "twelve wise men" were chosen, and their first duty was to select two of the brawniest negroes in the company, who, when called out, with much pride at that distinction, indulged in a good humored contest of strength, which was known as "rasslin' fo' de capt'in." The victor became master of ceremonies, and upon him devolved the duty of seeing that no one shirked in the work or entertainment.

The matter of the captaincy being decided, the "twelve wise men" chose four big fellows, who formed a "pack saddle" by crossing their hands and the captain was elevated upon it and carried half a dozen times around the heaps of corn, while the darkies sang this melody or something akin to it:

When our days am done
Don't we darkies cut a shine?
When our days am done
Don't we darkies cut a shine?
Back to our cabins we will go,
Back in the early mo'n,
But we'll be here in de eb'nin'
To do de shuckin' of de co'n.

Then the corn shucking proper began. Stacks of fuel had been placed at intervals of a few yards near the corn, and after they had been lighted, under the supervision of the "twelve wise men," the fun began. As the corn was husked it was thrown into piles and would be hauled away in the morning. Twelve workers were selected for each heap of unhusked corn, and, as back in New England, the red ear was eagerly sought for, but with a different purpose. When a man got it he shied it at a big nigger's head, and if he hit the mark the unfortunate darky would not "marry for ten years." If by shrewd dodging he missed it his happiness would be crowned within a year. If a dusky belle secured a red ear she had the option of choosing a sweetheart from any of the darkies around the corn pile.—Cincinnati Enquire.

TWO COLLEGE BOYS.

Two boys left home with just money enough to take them through college, after which they must depend entirely upon their own efforts. They attacked the collegiate problems successfully, passed the graduation, received their diplomas from the faculty, also commendatory letters to a large shipbuilding firm. Ushered into the waiting room of the head of the firm, the first man was given an audience. He presented his letters.

"What can you do?" asked the man of millions.

"I would like some sort of clerkship."

"Well, sir, I will take your name and address, and should we have anything of the kind open will correspond with you."

As he passed out he remarked to his waiting companion: "You can go in and leave your address."

The other presented himself and his papers.

"What can you do?" was asked.

"I can do anything that a green hand can do, sir," was the reply.

The magnate touched a bell, which called a superintendent.

"Have you anything to put a man to work at?"

"We want a man to sort scrap-iron," replied the superintendent.

And the college graduate went to sorting scrap-iron.

One week passed, and the president, meeting the superintendent, asked: "How is the new man getting on?"

"Oh," said the boss, "he did his work so well, and never watched the clock, that I put him over the gang."

In one year this man had reached the head of a department and an advisory position with the management at a salary represented by four figures, while his whilesome companion was "clerk" in a liverystable, washing harness and carriages.—Selected.

ILL VENTILATED ROOMS.

The subject of ventilation is one which is often sadly neglected in the average home. There are many households where the moral and spiritual atmosphere is pure and elevating, yet where the hygenic properties are so bad that poison is inhaled into the lungs with every breath. Well furnished, artistically decorated, supplied with every seeming comfort, yet foul in that one most vital essential, the air we breathe, these rooms are poor abiding places for the growing children that nightly cluster around the table to study, or to engage in games and social converse.

The air of a room containing several people becomes quickly contaminated and unfit to be taken into the lungs; yet it is safe to affirm that in many homes windows are seldom, if ever, opened in cold weather except on sweeping days. The only air which comes into such rooms being admitted only as doors are opened in passing through.

"But it cools the house off so!" a lady remonstrated, when I delicately hinted that her room was close, and needed airing. When I went on to state that it is impossible to heat impure air, she gave me a blank stare.

"Air that has been breathed over several times becomes so vitiated that no amount of fuel will give it the genial warmth to be found in well aired and ventilated rooms," I went on to say. "You complained a few minutes ago that the room was cold. Try opening the windows, to warm it." I suggested.

As I spoke, I threw up the three windows in the room, and opened an opposite outside door. A current of cold air immediately swept through the room causing my friend to rush for a shawl, lest she should catch cold.

"No need of that; we will leave the room for a while," I said, leading the way to an adjoining apartment.

When we went back, ten minutes later the air was fresh, but cool. In a few minutes, however, my friend acknowledged that the room was warmer than it has been before that day.

I advised this mode of procedure as a daily occurence, to which she readily acceded.

"Do you suppose this will make any difference in Elsie's head? She has complained a great deal, lately, of a dull, heavy feeling nights, when she is studying."

"I have not a doubt of it. Children are much brighter and can learn their lessons more easily in a well ventilated room. I speak from the experience of a teacher," was my final assurance.

I met this same friend a week or two later, and had the satisfaction of hearing her exclaim, as we met: "That ventilating scheme has worked wonders. Elsie has not complained of headache for a week; and we all feel 10 per cent. better since I have commenced to open windows and let some fresh air into the house."—Helen M. Richardson in Successful Farming.

LION AND DOG.

Little Willie told his mother that a lion was on the front porch, but when an investigation was made it was found to be the Newfoundland dog, which had been newly sheared.

"Now, Willie," said his mother, you have told a very naughty story, and you must go up to your room and pray for forgiveness, and remain there until the Lord does forgive you."

Willie promptly obeyed, but was gone only a few minutes before he came tripping back.

"Did the Lord forgive you?" asked his mother.

"Yes," was the reply, " and He said He didn't blame me either. 'cause when He first saw it He sorter thought it was a lion Himself."

Cookery Recipes

Chicken Biscuit.—A new and palatable dish is chicken biscuit. Dress and joint a plump broiler, salt, pepper and roll in flour, then put one and one-half cupfuls of boiling water into a small skillet, lay the fowl in and put in a lump of butter half the size of a hen's egg. Cover and set on the stove while you make some biscuit dough, that rolled half an inch thick will just cover the chicken and fit inside the skillet. Cut across twice with a sharp knife, set inside the oven and by the time the dough bakes the chicken will be done. A young broiler will be cooken in fifteen minutes, less time if the fire is hot.

* * *

Creamed Cabbage.—First slice fine sufficient cabbage and cook in plenty of water until very tender. Drain, and to a medium-sized cabbage add one pint of sweet cream. When it boils up remove from the fire, add a heaping teaspoonful of flour, stirred smooth in a little cold milk, and just before serving pour over it one-half cup of vinegar. Let it get hot, not boiling, and serve at once. This is very nice with the cream dressing alone, having much the taste of cauliflower; but the vinegar makes another dish of it entirely.

* * *

Deviled Eggs.—Deviled eggs are a particularly palatable dish and are prepared in the following manner: One dozen eggs, one tablespoonful of olive oil, one generous tablesspoonful of Fresh mustard, two heaping tablespoonfuls of cold boiled tongue, chicken or ham; salt and cayenne to taste. Cover the eggs with boiling water and cook fifteen minutes, then stand them in water until cold. Remove the shells and cut the eggs in halves. Take out the yolks carefully without breaking the whites. Rub the yolks to a smooth paste with the mustard and oil, the salt and peper, and mix well. Fill the whites with this mixture, put the halves together and press them. Wrap in white tissue, or paraffine paper, or fringed tissue napkins may be used, in which case arrange in a fancy basket and trim with delicate leaves.

COTTAGE CHEESE.

Cottage cheese is very palatable and nutritious and recent experiments indicate that it is more easily digested than fresh cheddar cheese. Farmers' Bulletin 202 contains some scientific directions for making this cheese from skim milk, whole milk, sour milk, etc. These recipes are elabrated from investigations of the chemical changes taking place in the souring of milk, etc.

If skim milk is used it should be kept at a temperature of 70 degrees F. until it is well curdled, which will usually require twenty- four to forty-eight hours. The curdled mass is then broken up by hand or cut by a curd knife and is heated gradually to 90 degrees F., and is kept at this temperature until the whey appears clear. When the heat is so applied as to require thirty or forty minutes to reach 90 degrees F, then the whey will separate clear in five to twenty minutes under normal conditions. The whey is then run from the curd and the curd is put in muslin bags or placed on racks and allowed to drain until whey ceases to come from the curd. The curd is then salted at the rate of about one pound of salt for 100 pounds of curd, or to taste, shaped into balls, and finally wrapped in oiled paper that may be obtained from any dairy supply house. For the finest quality of cheese the curd should be mixed with thick cream, preferably ripened cream, at the rate of one ounce of cream for one pound of cheese before being made into balls.

Directions are also given for the making of cottage cheese when a starter is used, when both a starter and a rennet are used together, and also when hydrochloric acid is used.

SETS OF CURLS.

The holiday girl likes to buy things in sets this year. She gets her collars and cuffs in sets, and when she purchases a new pair of evening slippers, she buys at the same time a set of different rosettes, so that she may wear the same slippers, and yet whenever she pleases, change their effect. And she is buying sets of curls, too, just think of it!—with no concern whatever she walks into a hair store, and asks for a set of curls. She generally designates her request by asking for a set of Turban curls, or evening curls. The new tip-tilted hats have brought about a craze for the Turban curls, and more than half of the smartly gowned New York girls are wearing them. They act as a sort of cachepeigne for the hat. The curls are mounted on a comb, and so can be easily fastened into the coiffure.—Grace Margaret Gould in Woman's Home Companion for January.

A DESCRIPTION OF OUR SAVIOR.

There has recently been brought to our notice this description of our Lord which we thought might be of interest to our readers. At the time when His fame began to spread in Judea, the Roman governor of that province, Publius Lentulus, wrote as follows to the senate:

"There is here at the present time a man of singular virtue, who is called Jesus Christ. The Barbarians esteem Him as a prophet, but His sect adore Him as a descendant of the immortal Gods. He restores the dead to life, and heals diseases by a word and his touch. He is tall and graceful of stature, His aspect is mild and venerable, His hair is of a color which can not be described, falling in ringlets below his ears and spreading over His shoulders with infinite grace. He wears it parted on the top of His head after the manner of the Nazarenes. His forehead is broad and smooth, his cheeks are tinged with a lovely bloom. His nose and mouth are admirably regular; His beard bushy and of the same color as His hair, descends an inch and separated in the middle it assumes the form of a fork. His eyes are beautiful, sparkling and clear. He reproves with majesty, and His exhortations are full of sweetness. Whether He speaks or acts, He does all with eloquence and gravity. He has never been seen to laugh, but has often been known to weep. He is very temperate, very modest and very wise. In a word, He is a man, who by His great beauty and His divine perfections, surpasses the children of men."—Hattie N. Connell in Western Farmer and Dairyman.

Some of our young men who stand around on the outside of the church doors puffing cigarette smoke will sometime stand around outside the gates of Heaven until they are closed, and then they will have to smoke somewhere else.

THE NEW YEAR THOUGHT.

To think the best of people, and not the worst, to say only kind and gracious words, to be brave and true and hopeful and undaunted, to rest on God's will as on a soft pillow, to keep the child heart to gray hairs, and to have the kingdom of heaven within you, are all parts of the duty, and belong to the birthright of good men and good women. To despair of none, to refuse help to none, to give, to lend, to love, to live for others, these are stepping stones to real happiness.—Margaret E. Sangster.

THE OLD FIREPLACE.

Said the old log fire: "I send the shadows flickering and dancing on the walls and sing to the little folks, and make bright pictures for them, as they watch my sparks go upward like fireflies in the night; and the old folks dream dreams of long ago, and hear the old, sweet voices, and see the old, loved faces in my flames. I bring them memories—some touched with tears, and others wreathed in smiles; and they draw closer to each other, and a deep sense of rest is theirs and sweetest sleep, that kisses down their dreaming eyes. I sing the stormy winds away, and the loneliness of the rain that dashes down the winter night. I am light, and warmth, and peace, and love, and rest."

WOE BE TO HIM.

George—I have been invited to a "flower party" at the Pinkies'. What does it mean.

Jack—That's one of the newest ideas this season. It is a new form of birthday party. Each guest must send Miss Pinkie a bouquet containing as many flowers as she is old, and study the language of flowers before ordering.

Florist's Boy (a few minutes later)—A gentleman left an order for twenty of these flowers to be sent to Miss Pinkie, with his card.

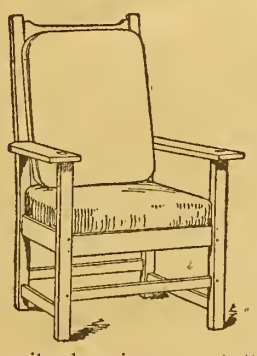
Florist—He's one of my best customers. Add eight or ten more for good measure.

SOUR GRAPES.

A gentleman wishing to send to a friend in England a present, chose a barrel of cranberries as his gift. It was in the early days before they had become well known in that country. To his surprise he received a letter from his friend in which he said: 'Your present of a barrel of berries arrived safelv, but we were obliged to throw them all away, as they had soured upon the journey."

"Dependable Furniture at a Fair Price."

True Mission Furniture



The Old Mission styles of furniture are the most favored and the most used now. The plain, simple lines and the peculiar finishes of the weathered oak and the dark rich mahogany are decidedly pleasing and are in strict keeping with the bungalow form of architecture which is so popular in this section of the country. There is a greater diversity of style and finish even in these special lines and just as great an opportunity exists for inferior workmanship. The mission furniture from the factory of the famous craftsman, Gustav Stickley, is acknowledged to be the finest in the country—made entirely by hand even to the smallest parts and every joint is mortised and pinned and made to fit perfe ctly We are agents here for this superior furniture and constantly carry a large and selected stock. All mail orders given prompt attention.

From the San Francisco Examiner:

LARGE CANCER IN HER BREAST

In Woman's Breast Any Lump Is Cancer.

Mrs. S. L. M. Crosley of 907 McAllister street, this city, was given up by surgeons to die over a year ago with large cancers of the breast, side and armpit.

She has just been cured with only two weeks' treatment by the use of that most wonderful island plant remedy used by Dr. and Mrs. Dr. Chamley & Co.

All the papers have been full of reports of their almost miraculous cures, but their success in this case surpasses all others. Honesty is their policy; they treat every case personally, without knife or pain, charge nothing until cured and offer $1,000 if they fail to cure any cancer they treat before it has poisoned deep glands or caused hemorrhage. They have the best 50-cent book ever printed on cancers, sent free to those who describe their cases.

Dr. S. R. Chamley, the author, is the acknowledged authority in America on cancer. This book is full of testimonials from doctors, ministers, bankers and hundreds of others cured in every town all over the Pacific Coast. To get this valuable book address 25 Third street, San Francisco, Cal.

FITS EPILEPSY

CURED TO STAY CURED

Eminent Judges, Ministers, Congressmen and the medical press declare my cures permanent. I cure after others fail. It doesn't matter how severe the case, I can cure it. I want to send you the proof. I will send you my booklet on Epilepsy by return mail FREE. Write to-day.

Los Angeles, Cal.

Los Angeles Markets.

Los Angeles, Dec. 28, 1905.

The produce market is quiet along all lines, due to the reaction from the spirited Christmas trading and the heavy damage by frost to many lines of vegetables, which were rushed to market in an endeavor to sell before the damage showed.

Eggs show an easier tendency, and a drop is expected soon. Poultry is well cleaned up and prices unchanged. Butter remains as quoted with fair demand.

Grapes about cleaned up, and the few remaining find ready buyers.

The directors of the Southern California Mountain Water Company have authorized an issue of 45,000 shares of stock at par value, which amounts to $450,000, for the purpose of raising funds for the construction work necessary to fulfill its contract to supply the city of San Diego.

San Francisco Markets.

San Francisco, Dec. 27, 1905.

Butter.

Fresh lines of extra butter were scarce, and were held at an advance, while the lower priced grades were plentiful at the old basis rates. The market for extras is now at a point that is likely to invite an influx of Eastern butter, which is available at much lower figures.

The steamer Bonita northbound from Ventura Sunday, December 17, loaded 144 boxes oranges, 132 sacks lima beans, 264 sacks walnuts.

The University of California has been invited to send a representative to the forthcoming conference of biologists that is about to be held in France.

The Alameda Encinal is strongly urging upon the citizens of its town the importance of incorporating into the proposed new city charter the principles of initiative, referendum and recall.

The Highland Messenger reports the formation of a civic league for Highland. A good thing to do. Every town of California of 500 inhabitants ought to have a civic league, or improvement club.

Over irrigation, says the Riverside Enterprise, is much more serious than a failure to supply a sufficient quantity of water. Most of the alkali lands in the state are a direct result of applying too much water.

The Bank of Oxnard doubled its capital on December 1st by adding another $50,000 to it fully paid up stock, which makes it one of the strong financial institutions of Ventura County and a potent factor in the business of Oxnard.

The Pacific Portland Cement Company of Suisan is arranging to more than double the capacity of its present plant, of which the output is 25,000 barrels per day. A second mill of ten kilns is to be built, the construction of which has already been commenced.

Next year will see the advent of the Eel River Power and Irrigation Company with their line to furnish power and light, which will give Ukiah an advantage over any other city in this part of the state. The Times is correspondingly in a joyous frame of mind.

The town of Auyiola, in Tulare County, is to receive a colony of settlers near it soon. A tract of land comprising 1100 acres has been bought and upon it 450 families will settle. The land will be cut up into 40-acre tracts, and out three miles from the Santa Fe track a town will be built. The land will cost the settlers about $19 per acre.

FACTS ABOUT CANCER.

A new booklet published at considerable expense by L. T. Leach, M. D., of 416 Main street, Dallas, Texas, tells the cause of Cancer and instructs in the care of the patient. Tells what to do in case of bleeding, pain, odor, etc., and is a valuable guide in the management of any case. It advises the best method of treatment, and the reasons why. In short, it is a book that you will value for its information. It will be sent by mail, prepaid, on receipt of ten cents, stamps or coin.

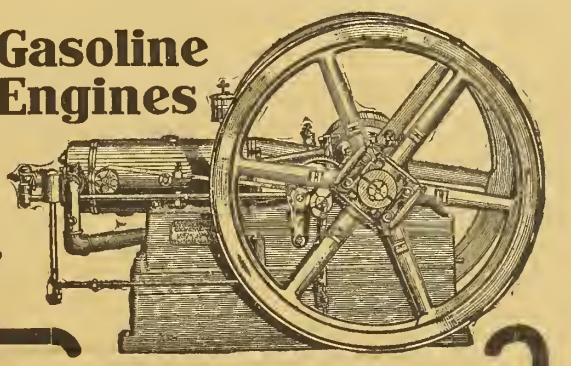
I. H. C. Gasoline Engines

Best For Irrigation.



WHEN it comes to pumping water for irrigation purposes the "I. H. C." Gasoline Engines will be found the **simplest, safest** and the most **durable and economical.** They can be attached to any kind of pump, in any position, for raising water from deep or shallow wells, reservoirs, canals or running streams. They excel in **full, regular and long sustained power.** They can also be used for a general purpose engine for sawing wood, churning, cream separating, feed grinding, etc. They give the maximum of power at the minimum cost. No expert knowledge or trained engineer necessary to operate them. They are unequaled for power of all kinds. Made in a variety of sizes and in two styles. **Horizontal or Portable 6, 8, 10, 12, 15 Horse Power. Vertical, 2, 3, 5 Horse Power.**

Call on local agent and examine these engines or write nearest general agency for illustrated catalog showing how they will save you money.

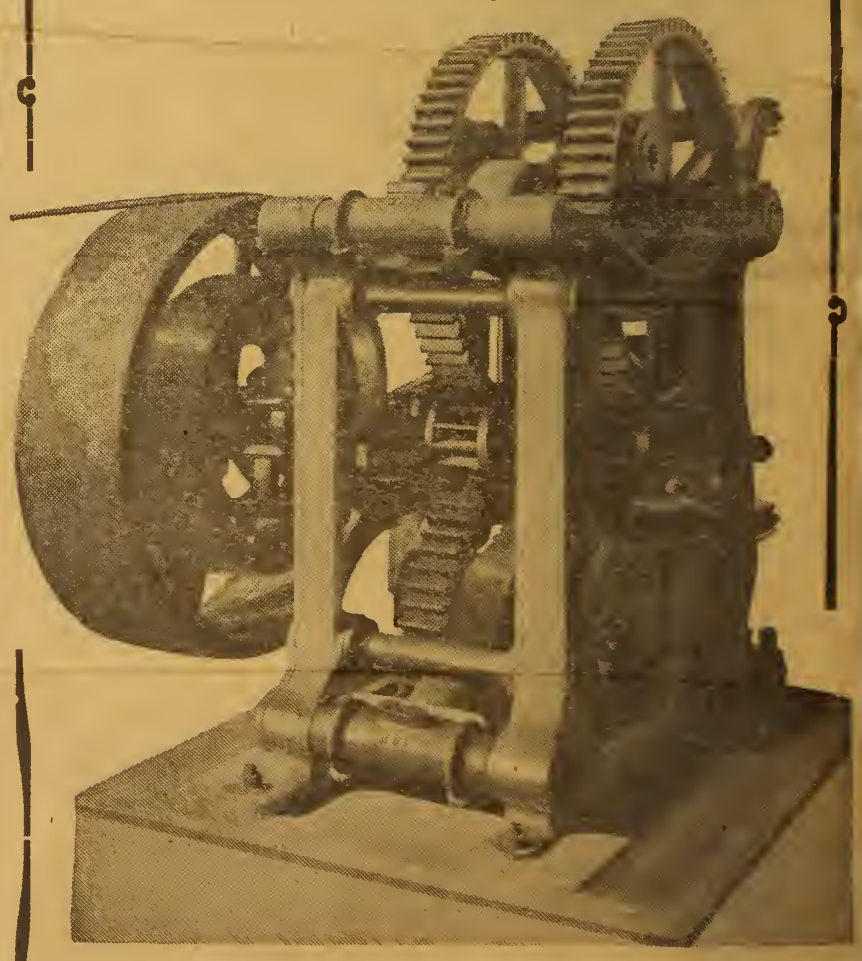
The Record for the New Pomona Pumps

FOR 1905

Not a Broken Rod, Not a Plunger Pulled for Repairs



The irrigation season just closing has demonstrated fully the high merit and efficiency of the New Pomona Pumps.

Every one installed has passed through the season's run without breaking a rod or requiring the valves to be pulled for repairs, proving conclusively that the ideal beam motion used by these pumps is more than has been claimed for it.

The slow, uniform motion upward and the quick, smooth down motion handles the rods without any jerk or jar, while the long lap of the plungers in passing the dead points, keeps the water column in continuous motion upward and a steady stream flowing from the discharge pipe.

They have passed through the experimental period and are built better than ever for next year.

The ideal pump for irrigation purposes. Send for catalog.
